TOP QUALITY PROFESSIONALLY DESIGNED PRODUCTS

MEGAROM

Hacker Pack V2

for Commodore 64, 64C & SX64

From the authors of Multi-Kernel and Mega-Kernel comes their latest and vastly improved product.

Megarom is a 32K ROM Kernel, replacement operating system, that will give even the most novice user complete control of all programs. This MEGA-CHIP has been completely designed by TOP HACKERS who wouldn't be without one. With MEGAROM anyone can get into, modify, and back-up any program whether it be on tape, disk or cartridge. MEGAROM is only limited by YOUR IMAGINATION.

Check out these unbeatable features:

- * 500 - 700% faster load and save of PRG files.
- * 20 + command DOS wedge incorporating Anti-knock, Turbo Stepping, and Unew.
- * Instant access from any program, to a machine code monitor.
- * IMAGE 64K RAM to disk in two non-compacted files in less than 40 seconds.
- * IMAGE 16K/8K cartridges to disk in less than 10 secs.
- * IMAGE any custom area of RAM to disk.
- * IMAGE any Hi-Res Screen to disk in Doodle format in only six seconds.
- * MAX IMAGE program will load in 30 seconds.
- * Doesn't tie-up any ports and is 100% compatible.
- * UTILITY DISK contains Disk Backup, File Copiers, Cartridge Backer, Bootmaker and over 110 popular Entry Points.
- * Multi-Kernel & MEGA-KERNEL owners can update to MEGAROM. Just send your chip and \$10 to us for PROMT UPGRADE.

Outstanding Value at \$69 + \$3 p&h.

SWITCHES

SWP: Allows the user to suspend absolutely any processor operation, during games, disk fast loads, etc... THEN continue at any time thereafter. Neat. \$10

SWR: Allows the user to RESET out of MOST games or programs, returning back to the basic screen. \$10

SWE: Allows the user to RESET out of ANY program when used with SWR. \$10

No soldering required

Special Offer - All 3 for \$25.

BITS 'N' PIECES

Definitely one of the finest collections of assorted action and strategy games, educational programs, mixed utilities and other general routines ever compiled for the C64. This disk incorporates more than 40 programs with titles like 90 Second Back-up, Home Inventory, and of course the LNG LABS special Menu-Loader program.

Only \$15 + \$3 p+h.

Send Your Bank Cheque or Money Order to:

MEGADOS V2.0

From the Writers of SUPERDRIVE MK II DOS

This is a drop-in replacement DOS chip for SKAI, CFC, FSD, TAIHAHO and 1541C disk drives. 1540 & 1541 version coming soon!

Once installed you have the following features.

- * 100% compatible with all Commodore software.
- * Software selectable 35/40 track formats.
- * Formats in 25/30 seconds.
- * Gives 664/749 sectors free (extra 21k storage).
- * Formats all sectors clean using 00 bytes.
- * No head knocking on Format.
- * Up to ten times faster track accessing.
- * Software selectable Anti-Knock on soft ERRORS.
- * Software selectable write verify ON/OFF.
- * Software selectable 4040 write compatible mode using 8 Header Gap Bytes.
- * EASILY INSTALLED IN MINUTES!
- * Note that early model SKAI drives with BLACK POWERPAK need a special version so please specify when ordering.

Only \$29 + \$3 p+h.

PLATINUM COLLECTION

This is the most incredible compilation of Graphics and Sound demonstrations that is available anywhere. These programs literally stretch the C64's graphics capabilities to the limit and beyond ... Using multiple Raster Interrupts, they achieve Extended Screen Resolution, up to 112 Sprites simultaneously displayed, and a spectacular array of colours.

The accompanying sound performances are vibrant, rich and beyond imagination ... they must be heard to be appreciated. Written by professional programmers from all corners of the globe, implementing many techniques that have never been seen before, your 64 is turned into a Mini-Amiga.

Each of the ten DISKS come complete with L.N.G. LABS special menu-loading system to provide easy loading. These disks will provide hours of sensory stimulation for the whole family or your envious friends. Add some Real Treasure software to your Chest of Disks.

Only \$49 + \$3 p+h.

Editorial

In their usual nonchalant fashion, Commodore are poised to release yet another bombshell on the home computer and small business market. Announced in vague terms by Gareth Powell in the *Sydney Morning Herald*, Commodore continue to remain very tight lipped about the existence of what we believe to be called the PC 5.

It is an IBM clone killer, priced to sweep clean the crowded floor of big blue look-a-likes. Selling at a mere \$999, not including the monitor, it has a single built in 5 1/4 inch disk drive, 512 kilobytes of RAM, five expansion slots, and for around \$1399 will be bundled with a package called *Able-1* and suitable monitor. We wait in earnest. Release date? . . . real soon now.

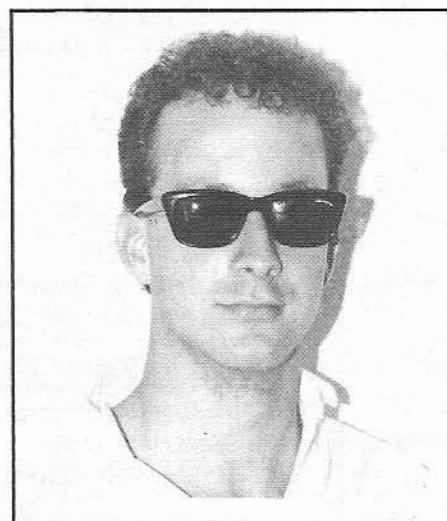

Of even more significance is the

delivery of a large bundle of goodies at the end of March - what can they be? The new Amiga perhaps? I will set up tent and camp fire across the street to bring you further updates.

Already 1987 is heating up to be another action packed year of developments.

And now a brief note about our number five disk magazine. Due to circumstances beyond our control, some programs were inadvertently left off initial runs of the disk. We regret this and wish to make it clear that recent batches do contain all of the programs originally intended to fit on the disk.

Do check your disk directory with the one appearing on page 29. If you are missing some programs, please feel free to send us your old copy to have it up-

RAM RUMBLINGS

Desktop Publishing available on Commodore 64!

A considerable number of dealers are now importing a new selection of packages for the Commodore 64 including Geo-Publisher and Geo-Laser.

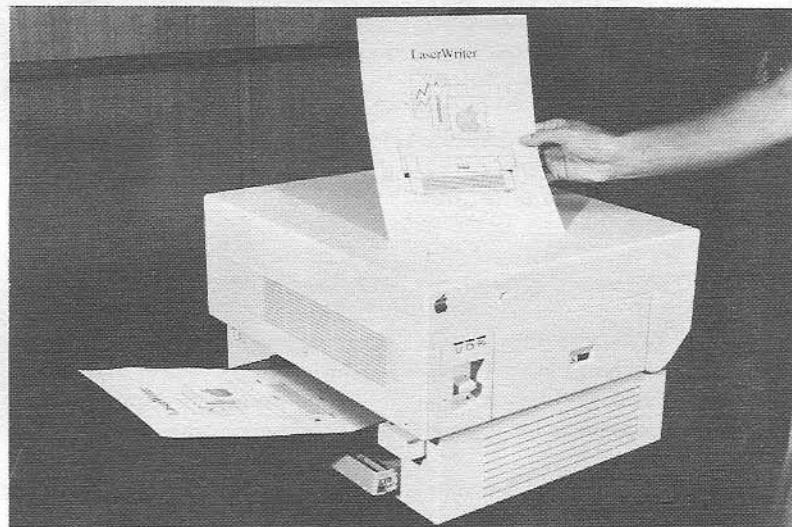

Using this software, along with the necessary cable and interface we expect it will be possible for the Commodore 64 to drive an Apple Laserwriter and produce pages much the same as a Macintosh or PC.

Producers of SYDCOMS user group magazine, Peripheral, are currently experimenting with the set up. Geo-Laser uses the Post Script language to drive the Apple Laserwriter thus producing high quality laser images ready for use in publications such as this magazine.

Along with its companion GeoWrite or the Writers Workshop, the GEOS environment will soon become a new home for desk-top publishing. A system could be purchased for many thousands of dollars less than has previously been possible.

No doubt such a drop in minimum system requirements will set the desktop publishing industry on end.

Watch out for an extensive write-up next month.

Commodore Review at PC87

If you're at the PC87 show in March, be sure to visit the Commodore stand to receive your free copy of our March edition. Reviews of several new Commodore products will be included as well as our usual round-up of news, games and plenty of programs, hints and tips.

It could also be your big chance to meet some of our dedicated staff who are cruising around the isles (wearing dark sunnies as usual). Don't miss it.

Programmers Wanted

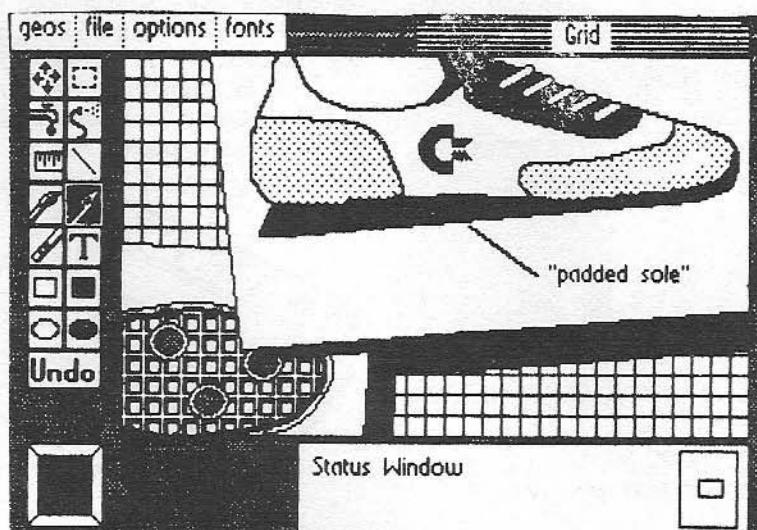

If you're a bright spark of any age or gender, and you can write interesting programs in BASIC or machine language, please contact us soon. We are looking for programs to publish in these pages, and on our ever popular disk magazine. Yes, you can even make a few dollars in the process. Call now on (02) 398 5111 for further details.

New Megasoft titles

Utilities can really make life easier, especially several of the new releases from Megasoft. Full reviews of all these packages next month, but just briefly there's a smart disk cataloging program that is a breeze to use and provides very convenient directories of your entire collection. After the disk directory has been read into the master catalog, you may edit out names of files which are not actually programs you run.

The software produces a complete directory in a variety of formats, as well as individual labels for specific disks.

Other releases include a BBS for both the C64 and C128, and the hallowed war-games dialer. Distributed by Pactronics, - very reasonable pricing.

Multi-User Switch

The Multi-User Switch from Micro Accessories offers the unique capability of operating up to twenty Commodore 64 or 128 computers with a single 1541 or 1570 disk drive unit.

This factor outshines the already available "VIC Switch" which only offers an eight way selection to the drive. But not only that, it also can be used in conjunction with the highly powerful and fast "Dolphin DOS" system offered by Micro Accessories.

Together the DOS and the switch offer a complete solution to the problem of sharing a single drive unit such as may be required in a classroom or user group environment etc.

The switch may be used as a simple 20 way serial switch but it is recommended that the Dolphin DOS conversion be done to the disk drive and a compatible Kernal be added to each Commodore 64 or 128.

Using simple mathematics one can appreciate the fact that what would probably take 20-30 minutes to load an average program into 20 computers will be reduced to less than five minutes with the use of the switch together with "Dolphin DOS". This cuts down the preparation time required for a classroom or user group activity to a minimum.

The switch owes this capability to a microprocessor which is constantly polling the users for disk access requests and instantly granting sole access to the drive to the user with highest priority. When the transfer is complete the switch is allowed to re-connect at lightning speed to the next in line.

Since the current user has sole access at any one time, data corruption due to cross talk and loading in the system is non-existent and it does appear as if the user has a dedicated drive unit during the access period.

Economically the advantages are obvious since only a single drive need be purchased for 20 users. And the fitting of "Dolphin DOS" to only one drive unit also means a large reduction in cost. The modifications required to the Commodore 64 and 128 are minimal and are the least expensive portion of "Dolphin DOS".

In summary, the switch is a facility not to be ignored by anyone considering the possibility of multi-user access.

Its high speed of operation and high user volume capabilities sets it apart from other systems.

For further information: Micro Accessories of SA, (08) 252 0881.

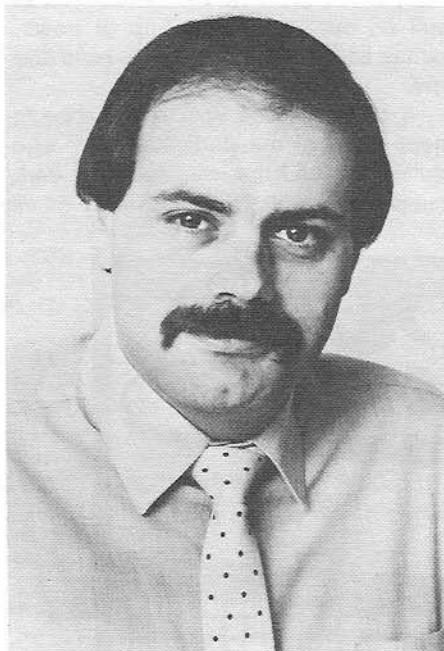

Family Pack Success

Commodore's Family Pack which includes the official America's Cup game has been a huge success, notching up an incredible 45,000 sales in the last ten weeks.

Sales remained strong as the racing off Fremantle drew to its inevitable climax.

Commodore Australia/Asia-Pacific managing director, Mr Tony Serra, said that the strength of the Family Pack together with strong sales of the Amiga and MS DOS machines gave the company a 30% increase in sales over the previous December quarter in Australia.

"The rocketing sales have come when the rest of the market has been happy to mark time," Mr Serra said.

*Tony Serra,
Commodore Managing Director*

The additional revenue has come at a time of much higher productivity by a more dedicated staff, following a re-organisation during last year. Further sales increases are anticipated over the next six months.

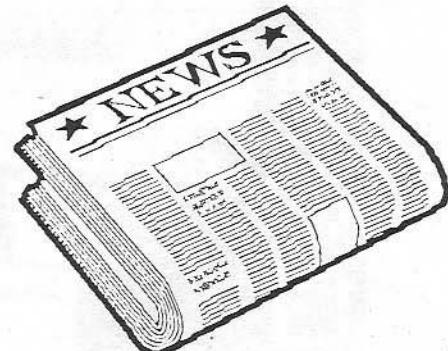

On the business front, Commodore will have three different Amiga CPUs as part of its 1987 line-up together with two new PCs and some new peripheral items.

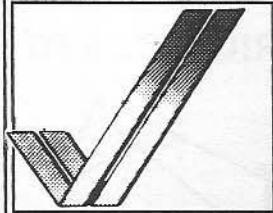

Mr Serra said, "We have geared ourselves for sales increases created by the strongest mix of available consumer and business computers ever seen in Australia from the many players in today's market place."

Commenting on operations of Commodore International Mr Serra said, "The strategies and goals established on a world-wide basis have continued to remain on target.

"This will be emphasised more in the near future with the visit to Australia by Mr Thomas J Rattigan, the President and Chief Executive Officer of Commodore International, in March for PC 87 and the Commodore Dealer Conference.

"1987 should be a boomer without any question at all for us, and will continue to strengthen the dominant position Commodore hold in the Australian marketplace," he said.

Letters

Dear Sir,

I am writing to you because I am in dire need of help. The problem is my Commodore 64, after approximately 15 to 30 minutes of use, crashes. The symptoms are that first a loud humming noise will come over the speaker, then shortly afterwards the screen will freeze and become full of irrelevant characters and other junk.

I have tried everything to solve the problem, but the only thing that seems to work is placing a fan behind the computer. I think the problem is something to do with the computer overheating, but this is only a theory.

Recently I had three chips replaced, these were the 6569 VIC, 6581 SID, and the 6526 SID chips. This hasn't helped. Any assistance would be greatly appreciated.

Matthew Griffith
Marsfield

ED: I can sympathise with your problem as one of our 128Ds recently suffered a similar problem. It appeared to be linked to some faulty memory chips. However the technician now informs me that he is waiting on a replacement power supply unit. Sounds like a problem for a professional - try Gabe at United Computers on (02) 29 5088.

Dear Andrew,

It may be going back quite a while, but in the December 1985 issue the "Rat" mentioned the RC1000 watch released by Seiko. I have not heard about the watch since then. Could you please send me some information on it.

In the August 1986 issue, a "Commodore 128 Incompatibility Chart" was published. I am curious to know whether the games listed are incompatible with the computer itself or the 1570/1 disk drives. I am curious because I own a 1570 (God help it) and

am thinking of buying a 1541 as well so I can load all software. I was told not to throw my 1570 in the bin because it still makes a very good boat anchor.

In an article written by Paul Blair in the May 1986 issue of *Australian Commodore Review*, he mentioned that he hadn't the faintest idea of what COLINT, MOVESHAPE, RLUM, RREG, and RSPR did. I now know that RREG returns the values of the Accumulator, X and Y, and Processor Status registers. The format for the command is: RREG variable 1, variable 2, variable 3, variable 4. It works in both immediate and program modes. Its abbreviation is R shift-R. I knew it existed because it was listed in the keyword table in the Basic Rom. I extracted the rest of the information from "Compute!'s 128 Programmers Guide."

An interesting SYS call on the 128 is 32800,123,45,6. This brings up six names, at least one of whom can't spell "hardware", and an obvious protest against armaments. Its equivalent on the +4 is 52651. Something even more interesting is that of the names that came up, I think that nearly all of them helped to write the "Commodore 128 Programmer's Reference Guide."

Something else interesting is that the previously mentioned book does not to the best of my knowledge, mention RREG, even though it was written by the designers of the computer.

I'm getting a modem soon and would appreciate it if you could give me the phone number of your bulletin board which the "Rat" noticed to be out of action.

Are your disk magazines 1 to 4 still available as I'm interested in purchasing them.

I'm also very interested in electronics and radio. Do you know

where I might find radio communication equipment for my computer? I never see it advertised anywhere.

I have only one complaint centred on the *Home Computer GEM*, why do you only publish hints for the games on tape?

Lastly I would like to congratulate you on two excellent magazines, *Australian Commodore Review* and *Home Computer GEM*. ACR has given me many hours of enjoyment.

I anxiously await your reply to my perhaps too lengthy letter.

Kyle Grimshaw-Jones
Oxford Qld.

ED: Well, what a plateful. Let's start at the top and work down. Firstly, the watch mentioned was distributed for some time, however a similar version which is somewhat better is now available from Casio. Best to give one of their dealers a call.

Software compatibility with the C128 is a problem primarily associated with the 1571 and 1570 disk drives, as the ROMS differ substantially from the 1541. However there are also a handful of packages which are incompatible with the Commodore 128's slightly different architecture even in Commodore 64 mode.

Our BBS is still off line - but you'll find a huge list of other systems around in the January issue of *Australian Commodore Review*.

Disk magazines 1-4 are available, along with disk magazine number five, just released.

As for radio communications on computer, CW Electronics did have such a device, however I have neither seen nor heard much about it of late. Can anyone else help?

Disk based hints and tips are arriving slowly.

AUSTRALIAN COMMODORE REVIEW

Dear Sir,

In *The Australian Commodore Review*, Vol 3 No 8, August 1986 there was an article on the Commodore MPS-803 printer by Tim Walsh. In this article he said that you could buy the MPS-803 printer for \$100 or less. Could you please tell me if this statement is correct and if so where I can buy this printer for this price.

Gary Hurst
Rose, SA.

ED: Sorry, they were US \$\$\$ - our apologies.

The MPS-803 has been discontinued. In its place is the MPS-1200 which sells for \$550 (Aust \$\$\$) and has better quality at 100 cps.

Dear Sir,

A question in the mind of many Commodore 128 owners, including myself, is that of connecting a reset

switch to the C128, which works in both 64 and 128 mode, without disturbing the computer's memory. Does the reset switch on the side of the C128 serve this purpose or is it simply an alternative to turning the computer off and then on again?

If a reset switch is set into pins 2 and 6 of the Serial I/O port and the C128 is in 64 mode, will the computer reset and stay in 64 mode, as on a normal C64, or will it pop back into C128 mode as by pressing the in-built reset button?

Could you please answer my question as I dare not fiddle with my C128, in case disaster strikes.

Patrick Danek
Cowan, NSW.

ED: The 128's built in reset switch works exactly the same as the one you described on the serial port. There's no need for any further switches.

Dear Sir,

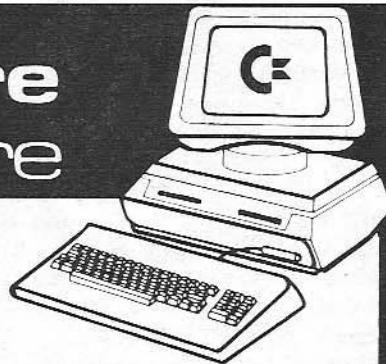

I have just bought the new Commodore 64c. I am fascinated by the things it can do and how very, very popular here. However, I bought some magazines so I could get into programming and in the UK magazine "Your Commodore" it showed some machine language. And so I typed it out and when I typed RUN and return, it just said Syntax Error READY. So I checked the program and nothing was wrong so I ran it again, it said the same thing. Now can you please tell me what do I need for machine language and how to use it.

Richard Sanchez
Eastlakes, NSW.

ED: Machine language may only be entered using a suitable monitor or Assembler. You cannot simply enter the listing directly as you would a BASIC program.

Easy Intercomputer Connection

A simple 3-wire RS-232 interface

This article describes how to connect together two Commodore 64s, VIC 20s, +4s or any combination of two of them. Implementing this connection requires only a user-built cable and some BASIC programming; with the cable in place, any kind of data communication between the machines can take place.

Today the price of a Commodore 64 or VIC 20 is very affordable and many owners of one machine are tempted to buy a second one. If you are attracted by this possibility or you already took advantage of it, I am sure that one of the most interesting projects you would like to accomplish is to connect the two machines together and run somehow in a dual processor environment.

There are actually several ways to connect two micros. The fastest and more versatile would be to use the cartridge expansion port; this would require an interface cable and a program or subroutine to handle the protocol. This protocol naturally should be designed around the signals available on the port and would be almost impossible to write in BASIC because of the speed needed to handle these signals.

Another connection could be made through the user port. This would not be as powerful as the first one and would need an interface cable and a protocol handler. This program or subroutine could be written in BASIC, but the speed would suffer a lot. Several examples of this connection can be found in computer magazines, and are almost all based on the concept of parallel data transfer.

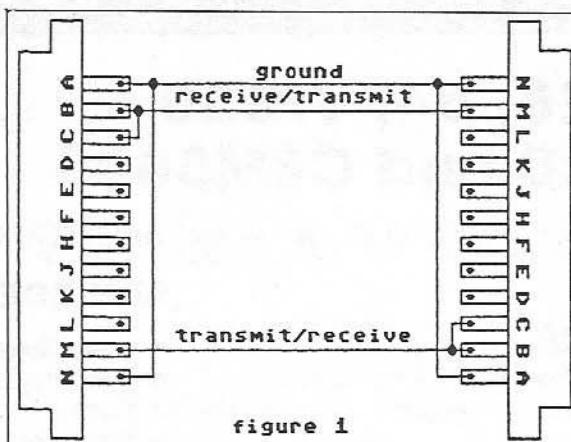

RS-232

The third way of connecting two machines is using a serial connection, known also as RS-232. This line discipline is an industry standard and can be used with various protocols.

On the Commodore 64, VIC 20 and

+4, RS-232 protocol is built into the Kernel and can be used with an adapter via the user port. Why do we need an adapter? The answer is that to save on cost for an option not always used, Commodore decided not to use true RS-232 signal levels, providing instead an optional extension on the user port. This means that in theory we cannot use the RS-232 line discipline without extra hardware, but actually that hardware is needed only to translate the TTL signals generated by the motherboard into the RS-232 signals accepted by some serial equipment.

The cable described in this article does not need any translation, because we use all signals at their TTL level, allowing connection of the Commodore machine using this feature. In addition, it uses the simpler '3 LINE' handshaking, requiring only Ground, Received Data and Transmitted Data lines.

Building the cable

To build the cable, you need to get two connectors compatible with the user port. I got mine at a local electronics store and I am sure that, being a pretty standard product, they are available everywhere. Another thing you need is any three-wire cable. I used a flat cable just because it happened to be in my junk drawer; a handy telephone cable will do a

fine job too.

Referring to figure 1 you can make the few connections needed. While the connections are not many, if you are not familiar with a soldering iron and small projects, I suggest you rely on a friend to avoid a possible waste of time and money.

Here is a brief description of the cable functions; for complete information, page 355 of the *C-64 Programmer's Reference Guide* gives all the user-port pin-outs with the names of RS-232 signal lines. If you hold the connector with the protruding pins facing you, place the side with the letter 'A' on the left hand top. If the connector does not have letters and numbers, just assume that the leftmost top pin is 'A'. As you can observe from the connector or from the *User's Guide* page 143, not all letters are used; the exact lettering is A B C D E F H J K L M N.

Connect pins A and N with a wire bridge; those are both ground and their connection is a good practice. Make another bridge between pin B and C; they handle both the Received Data signal, but pin B is internally connected to a detection circuit, able to generate an interrupt when a character is coming from the line. Do the same bridges to the other connector and now you can link the two by the three-wire cable. If the wires are different colours there is no problem, else better make sure with a tester or some other means which wire is which on each end.

Connect first the ground, pin A or N, both sides; then connect pin M on one side to pins B and C on the other side; this is the Transmitted Data connected to the Received Data. Do the same connection for the other wire in the reverse direction. Now both connectors should look the same, with pins A, B, C, M and N soldered somewhere. To complete a durable connection, the connectors should be put in a headshell of some type which covers the soldered connections.

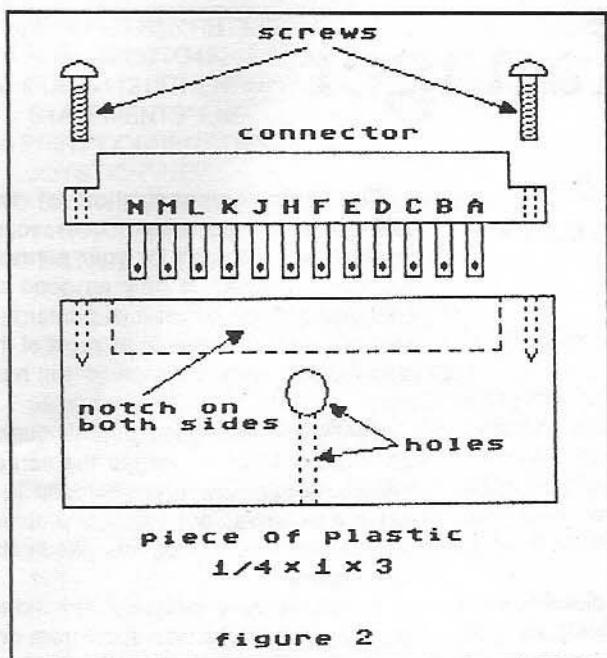

figure 2

Headshell

I chose to make my own headshell from a piece of plastic of 1" by 3" by 1/4" (25mm by 75mm by 5mm). In figure 2 there is a sample of this home-made assembly.

First I filed down one edge on both sides to fit between the top and bottom rows of connector pins. Then I drilled two holes corresponding to those on the connector, to fit the holding screws. Next, with the width of the cable to be used in mind, I drilled a hole about 1/2" or 15mm deep into the edge opposite the connector pins. Last, with a very large drill top and gouge, I carefully opened a hollow into the 15mm cable hole, through which the cable will be brought to the surface of the headshell.

The cable can be inserted into the hole with the wires coming out from the hollow and connected to the pins. A couple of pieces of insulating tape on each side of the headshell to cover the pins should finish the job. Do not forget to pass the wire through the hole before making the connection if you choose to make this housing.

It is very important to mark the connector with a label indicating the side that must be up; inserting the cable in the wrong position will mean connecting to +5V and +9V power sources. It is easy to determine the position looking at the finished connector; the side with no soldered pins is the top.

With one end of this cable plugged into the port on each of the two machines, it is now possible to transfer any kind of data directly from BASIC. The built-in RS-232 routines allow communication by simply OPENing a file to device number 2 and getting GET# or PRINT# to receive or send.

Using a data word length of eight will allow you to transfer not only alphanumeric but the full Commodore character set (graphics, tokens, etc.) making it possible to transfer BASIC or machine language programs, graphics, portions of memory, etc.

To test the cable you can use your favourite terminal emulator program on both computers, or if you're using C64's or VIC's you can use this simple one:

```
10 open 2,2,2,chr$(8)
15 rem above sets: 1200 baud, 8 bit, no parity
20 get#2,a$:get b$: print a$;b$;
30 if b$<>"" then print#2,b$;
40 goto 20
```

With the above set-up, you can communicate between computers simply by typing on either keyboard. As a practical use of this communication channel, you could set-up a distributed processing system. For example, in a database system, one computer could accept input from the user while the other maintained the database on disk. That way, a record could be sorted and stored on one computer while the user is entering the net record or typing in a query on the other. This would result in major time savings in most circumstances.

Solid Software's
LOTTOcheck 18 7 31 16 15 37

for the Commodore 64 & 128 Computers.

LOTTOCHECK is now available in 3 versions:

- TATTSLOTTO (45 numbers),
- GO LOTTO (40 numbers NSW),
- POOLS SIX-38.

- Developed by database and graphics experts, Lottocheck includes a database of all past draws which are analysed for winning combinations. (You update the database as new draws occur).

- You can select any set of numbers or a System entry and Lottocheck goes through all past draws tallying up all prizes in each division, that would have been won with those numbers. Thus letting you analyse the performance of any set of numbers.

- You can select random numbers, which appear on screen as bouncing coloured balls.

- The GRAPH option produces a histogram of the frequencies of numbers drawn, up to the present.

- The powerful EVALUATE option lets you test theories and predict next weeks draw, using computed rankings of all numbers.

- Other options include list and print together with the usual database functions ADD, INSERT, MODIFY and DELETE which use professional fullscreen, form-like input screens.

- Package includes program and data disks plus extensive handbook on Lottocheck, winning strategies, and the maths theory of LOTTO. Excellent value at \$49.50 each version (includes postage), payable by cheque(), money order(), or credit card:

Please charge my Bankcard () Visa card () (tic payment method):

Business Manager

Balance the cheque book and budget for that second disk drive, modem or printer using Business Manager. Andrew Farrell put this Aussie package through its paces.

I have never been a great one for keeping records of things. As a result my life is in continual disorder and disarray or disorganisation and also distress. That is until I got Business Manager. Now I can see that I am underpaid, overworked and underfed as J Mark Hunter so aptly pointed out.

Nevertheless, I write on. If you have trouble keeping track of all those nasty expenses and balancing them against the Thursday pay packet then you need this program.

One year's trading is stored on a disk, with 50 expense categories and two income categories. These may be spread amongst 200 different account names, with up to 150 expenses per month. Periodical payments like your car finance, housing loan, or alimony are also allowed for.

Both monthly and yearly summaries may be printed and you can also make a

backup of your data - so important in Sydney's stormy weather.

Upon booting up (the program appears to fast-load) you are asked whether or not you require instructions.

A neat idea that immediately overcomes all those people who, like myself, are too lazy to look them up in the manual.

Although the on-screen directions are brief, the program is relatively easy to understand, and each option is described in clear terminology.

You are next asked to insert a data disk - or a blank formatted disk if this is your first time.

Next, the main menu, where thirteen different options provide access to the program's facilities. Some of these require the program disk to be reinserted. Although this is rather annoying, the program takes little time to load whatever information it needs.

The best demonstration of the package is the reports it produces, some of which are included for your perusal. Any such program is only as good as what you can get out of it. A printer is a necessity in this instance, as most of the reports may only be viewed on hard copy.

On screen editing is tight, although I would have liked to change the screen colours. A tad slow if you're used to a faster disk drive, but that's a problem facing any program of this ilk on the Commodore 64.

In all, a very practical functional program that works well apart from one small gripe. The restore key has not been fully disabled, which I worry may lead to the loss of information, and possibly the corruption of valuable file data. Perhaps the next version will have this problem solved.

An Australian product from a company who promise they intend to bring out many more such titles and are on the lookout for authors. Further enquiries should be directed to Software 64 at PO Box 483, Croydon, VIC. 3136.

Rich man, poor man, beggar man, pirate

Pirates beware, software houses are preparing to do battle. This time they are well armed - thanks to a new group of vigilante type organizations who are providing confidential leads as to the identity of offending individuals. By Andrew Farrell.

Guessing as to the extent to which sales are lost to the whirring dual disk drives and lock picking programs is no easy task. Estimates run as high as 100 illegitimate copies to every dinkie package sold off the shelf.

Dollar value of these losses varies considerably, but for now the issue on the minds of software companies is not to establish what has been lost, but rather to find ways of reducing the deficit in the future and to establish alternative policies to ensure the problem does not worsen and possibly even improves.

Some feel that one means to this end would be to make an example of a few so as to inspire dread in the souls of similarly minded people. Would this simply lead to a tightening up of pirates' means and methods? Would they set sail for smoother waters elsewhere? Or perhaps they'll just build bigger battleships. Whatever the results of such action, no doubt the pirates will continue to thrive for the moment.

How to spot a pirate

You won't find him standing at the helm of a square rigger, or hobbling along on one leg to the sound of a squawking tattered cockatoo. Although he does have a ship of sorts, and even a crew, and he certainly has a sword.

He tends to be a little blasé about his activities or achievements. His sword is the latest swag of copy breaking devices and programs. His ship is the protective surroundings of his immediate peers who equally enjoy the fluid supply of free software. More often than not the modern day pirate's clipper is the 'User Group'. Founded as a means by which users of a particular brand of machine may swap ideas, exchange information and try out new products, they sometimes turn into full scale swap clubs where even pre-

release versions of programs are readily available to all and sundry.

But the moon has shifted and the tide is turning. Responsible members of the public have recognized that the activities of a few are destroying the future for the masses of users who need the support and backup that off the shelf purchases provide.

Small groups are springing up, who, in vigilante fashion, provide positive leads to prime offenders of the copyright laws.

Their identity is confidential, their activities are secret, yet they strike hard and fast. One such group is called GASP. Perhaps they are the last gasp for the industry, or a fresh breeze of air that may well prove to be a curbing force in the field of piracy.

The name stands simply for Group Against Software Piracy. Their ranks are diverse - industry professionals and figureheads down to backyard hobbyists. They work by penetrating the ranks of user groups, bulletin boards, and computer circles in general to establish credibility and ascertain ring leaders in the piracy game.

Once sure of their findings, names, addresses and the alleged activities of these persons are passed on to software houses in the hope that further action will be taken. Some companies do respond with stern letters demanding action. At

this time no case has ever been followed through to a court of law, as most people respond in a cooperative fashion, ceasing further illegal activities.

Providing that these scare tactics continue to be effective, groups such as GASP will achieve much in cleaning out the rotten wood. If you are involved in pirating computer software, be warned. It is an offence that may warrant investigation by the authorities.

So, perhaps it is time to hoist the sails and set a course for new waters for all those wooden legged maties out there. Tinker, tailor, soldier, sailor. Rich man, poor man, beggar man, running scared.

Animal Kingdom

by J Mark Hunter

In my study where I have my computers set up is also an aquarium with cold water fish in it swimming amongst the plants and orange gravel. Okay, they're not exotic saltwater varieties and only some bulging-eyed black Moors and orange goldfish, but we were kind of close. They are peaceful to view and cheap to feed. If one dies I can easily replace it with another for just a buck fifty, but I've had a couple of them for over six months now and they've guided me silently into a lot of hours clocked in front of this computer, looking over my shoulder at the screen to see what I'm writing as they methodically gape their mouths around the tank.

Four citizens of the Animal Kingdom. And, yep, there's a game for that too. Unicorn Software of 1775 East Tropicana Ave, Las Vegas, Nevada, 89109.

Now, should we be cautious about what we're feeding our kids, and especially if it's being developed in the sin capital of the American west?! Naa, cos I've checked it out and there's nothing perverse or crooked in the whole disk. The cost of the products these days might be a rip-off, but that's about all.

This is a game that's not too cool, but junior's going to like it for a dead afternoon in fall.

Animal Kingdom is an Early Science program consisting of six different learning levels. (Early Science is like kindergarten birds and bees).

It teaches you all about animals with an electronic animal encyclopedia, it shows the kid a picture of an animal in its native habitat and asks Becky to identify it by spelling its name. Not content with just labelling it correctly, the kid must first unscramble the letters to get the proper appellation.

There's a category called "Who Am I?" - object: the child/kid/little human/small persona etc, must correctly identify an animal's mug shot from several details

about its nature, behaviour and habits. "What's Different?" is an activity where the child must select which animal from six animals depicted is from a different species. Incorrect answers are given detailed explanations. An animal memory game is a concentration game for one to four players featuring an enchanting pictorial display.

Better than alphabet soup and more technical than McDonaldland cookies, *Animal Kingdom* will teach children about the many different species of animals ranging from prehistoric animals to reptiles, insects, nocturnal animals, birds, jungle creatures, pets, etc, while augmenting their language arts, reading comprehension, discrimination and memory skills. A special way to introducing kids to the intriguing wonders of science and nature.

To take a closer look let's get into the "Who Am I?" category. Six animals appear on the screen. A brief explanation of one of the animals will be displayed at the bottom of the screen. Enter the number corresponding to that animal's description and if the answer is incorrect another explanation will come up. If the

answer is incorrect, try it again. After a second incorrect response, the true answer will be shown. After two sets of animals the score will be displayed.

For instance on came up saying: "I have a snout and a long tongue. I like to eat termites and ants. I have sharp claws. Who am I?"

Hmmm? Then, it had pictures of a penguin, elephant, scorpion, anteater, eagle and turkey. I picked turkey and was wrong. But it was a learning experience. Now I know that penguins eat more than fish, let me tell you.

It is important to note that young children and beginning readers will need help reading the descriptions included in this program module. Once they have become familiar with all the animals in the program's library they can enjoy the other five games with minimal supervision. (Chester used to help me, but now, Chester's dead).

All about Animals is an introduction to the various animal groups and some of their characteristics and helps you understand the other sections of the program more easily. It presents a sampling of members from each of the

EDUCATIONAL

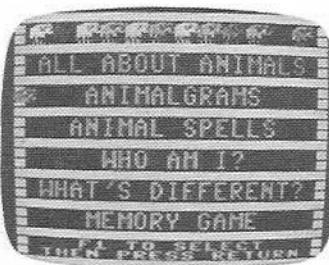

groups included in the program's graphic library.

The graphics on *Animal Kingdom*, though, are poor, and the colour dulled into a lot of flesh-coloured areas of the screen display. A kid will enjoy it, but not for long. At seven they're going to want to start into something heavier, like *Strip Poker* so I'd suggest getting into chewier material right from Run/

Stop and things like the Disney products do that with quality ease.

Should not be passed over, though. If the kid in your house has all the others or if you have an infant that already speaks Burmese then *Animal Kingdom* is the disk to boot.

Besides, he can always chew on the box.

THE "USER-FRIENDLY" COMPANY

WIT ELL!

TRAILBLAZER

by J Mark Hunter

Northern California. An hour's drive south of San Francisco Clint Eastwood just became mayor of the most precious and delicately beautiful city I have ever seen - Carmel.

I was on the beach, and it was sundown. Clint wasn't there, but present with me were four Brazilian female models dressed in beach attire. And there was a photographer, a director, and one other man I talked to first. The chairman of the Brazilian Council of Shopping Malls, in the United States for a convention.

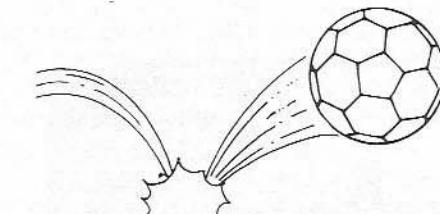

He had rented a car in Frisco and driven down to Carmel late that afternoon to watch the photographic session because one of the models was his girlfriend. As soon as it was over they were leaving immediately to catch a night flight to Chicago. The session had gone on longer than scheduled. The Brazilian chairman became quite frustrated and urged the photographer to hurry and get the session over with.

The photographer, a hotshot professional from L.A., was starting to get a little incensed at the continual harassment from the South American and returned a volley of abusive shouts. A fight broke out and the photographer was knocked to the sand.

The other man, the director, tried to intervene but to no avail, and the models started screaming either in excitement or fear.

They were wrestling around on the sand and it was all in their faces and eyes. The photographer called for a truce and the chairman finally agreed, demanding that his girlfriend be allowed to leave.

When permitted to get to his feet the LA guy stood away brushing sand out of his hair and cursed the Brazilian, then turned

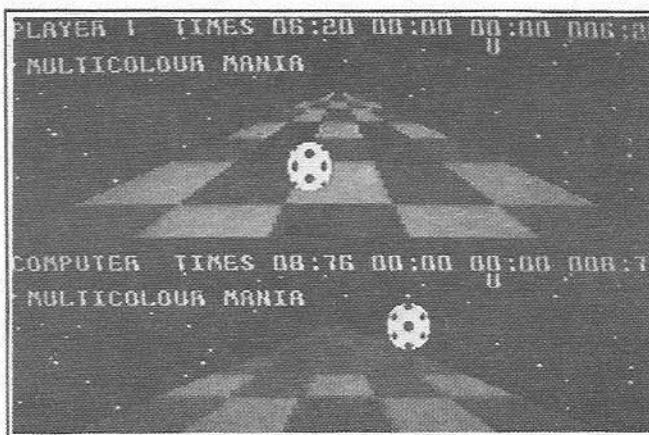

his attention to his girlfriend and swore that she'd never work with him again.

The model started crying and told her boyfriend she refused to go with him to Chicago. He stormed off the beach and sped away in his rented Cadillac. The session was ruined. This is where I came in.

Because the photographer was so upset, he took it out on everyone concerned and all the other models became embittered toward the Brazilian's girlfriend and left her stranded on the sand. She started crying, but there was nowhere to go. She didn't want to head back up the beach to the hotel because she was sharing a room with one of the other models. And she couldn't go much place else because all she was wearing was the bathing suit. A gorgeous Brazilian model was stranded on the beach after sundown ... and J. Mark Hunter was there.

Dot, dot, dot.

We had coffee, and I had a copy of *Trailblazer* in my car.

From here on in I'm going to tell you about the game - if anybody wants to know what happened later you can write in to the magazine.

Here's a quote that I found myself ranting during the course of the game: "totally excellent graphics", yes, cos they are. Some of the best I've seen for so, so long. Farrell practically shoved this game into my hands when I got in the door the other day and said you just have to play this game!

And we played the game, and the magazine became another day later.

Then there was talk about the colour, described as great - you don't get into Thesaurus kind of language when you're busy at the screen, man, "great" babbles forth pretty regularly. "Great playability."

"What did you say?"

"I said, great."

"Oh, yeah, great."

I noted with pen and A4 bond paper that I was loving the game.

So, what's the game?

Determination, speed and dexterity - the key assets needed to complete *Trailblazer* successfully.

Thundering into the unknown at breakneck speed, like an empty car on a transit lane at peak hour, agile negotiations of what's there, like bends, other things. Got to roll left and right to avoid cracks, but at the same time being careful not to fall off the edge of the path as you go.

What am I talking about, how do you play this thing?

Well, the aim of the game is to guide the ball down each of the 21 different courses as quickly as possible while avoiding the holes and other obstacles. Each course has its own time limit and there are five selections.

It's like a pumped up bowling game but much more. More like being on a skateboard going down a mountain road with no way of braking and fist size rocks littered down in front of your path.

You are limited to seven jumps per course and have a set time on each one. If you get through a course faster than the clock can tick down the remaining time is added to your next run. You get the greatest score by completing as many courses as possible.

You bounce from one square to the next, with maximum velocity issuing the highest scores. There are ten points per square and 100 per square on warp. Additionally, there are bonus points for time remaining on completion of a course and 1000 extra points per round on bonus game every three levels.

The various squares you must contend with are characterized by their colours.

Blue - bounces your ball into the air.
Purple - throws you backwards.
Cyan - reverses the controls, i.e. a left move becomes right.

Green - speeds you up.
Red - slows you down.
White - warps you out.
Colourblind people can go hellbent and kamikaze.

Reminds me a little of *ElectraGlide*, or any other type of racing game, but here you're manipulating a ball through the treachery and ignorance.

It's fun, nobody dies and not a bullet or missile is shot. It's colourful, entertaining and demanding and should provide you with a lot of fun.

The Brazilian girl liked it, but then, *Frank Bruno's Boxing* would have had the same effect.

WORLD GAMES

WORLD GAMES

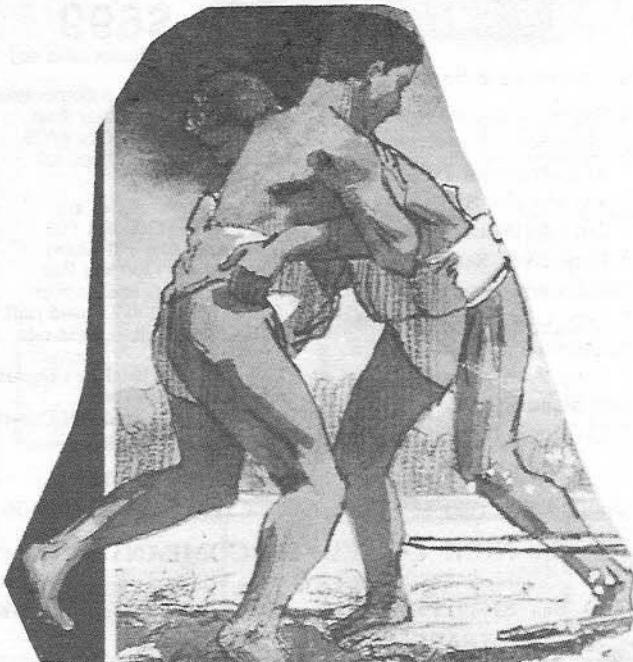

by Stephen Gordon and Shane Watts

There aren't many sport simulations available for the Amiga at the moment. One of them, *World Games*, is Epyx's latest addition to their famous collection of sporting games.

World Games challenges your competitive skills with a series of athletic contests of one to eight players. The lineup of eight realistic and colourful events takes you on a journey around the world. After sharpening up our skills at each of the events we took our tour of the world to complete in *World Games*.

Weightlifting

The scene for this event is in Russia, home of the best Olympic weightlifters in the world. The Soviets have ruled the 'Iron Games' since 1960, when 3601b giant Leonid Zhabotinsky squashed his competition by hoisting 1262 lbs in three lifts. The two events, 'Snatch' and 'Clean and Jerk' require timing, skill and determination.

Snatch: After setting the weight you bend down as you grasp the weight, pushing the stick forward to begin lifting, and pulling back to drop underneath the bar and snatch it over your head in the squatting position. You then push the joystick forward, standing up from the squatting position.

Clean and Jerk: This one is a bit harder, requiring more precise timing in the moves. By pulling back on the joystick you 'clean' the bar and drop into a squat position, with the bar resting on your chest. By pushing forward you stand up from the squat, and to jerk the bar above your head you pull back again. To straighten your legs and complete the lift you push forward.

Barrel jumping

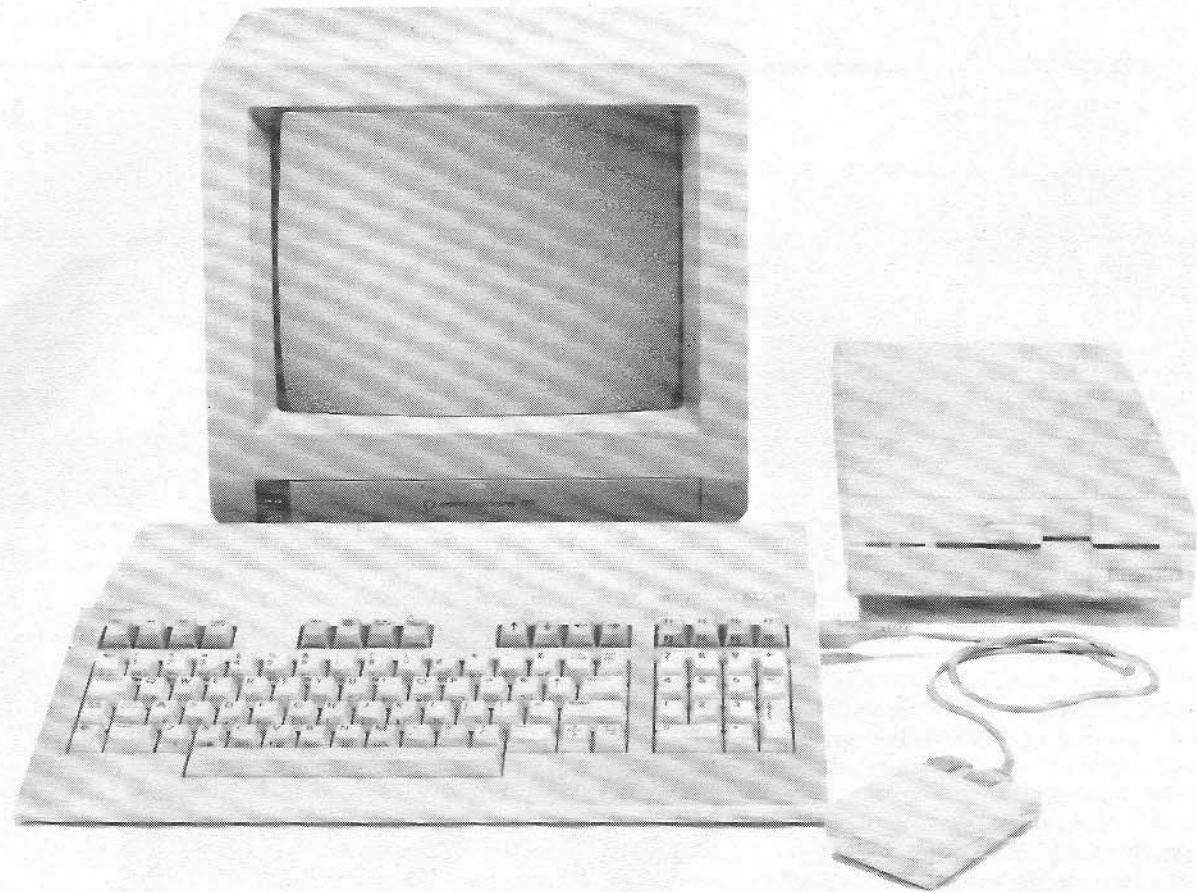

Barrel jumping takes you to Germany, where skaters compete to jump over the most barrels in a single attempt. In their dash before take off, jumpers hit speeds above 40 mph, risking painful bruising if they fail to clear the last barrel.

After choosing the number of barrels you wish to attempt, you start the skater's legs moving by rhythmically moving the joystick left and right with his legs. By pushing the button at the precise moment, you leap in the air, hoping that you have enough speed to clear the barrels. Once cleared you pull down to enable a safe landing. (If this is not done you fall through the ice and watch yourself turn ice cold blue as you freeze in the water.)

Cliff diving

The cliffs of sunny Acapulco, Mexico, provide the setting for this dangerous sport. High on a cliff named Quebrada, courageous divers launch themselves from a craggy ledge towards the crashing surf far below. To avoid the rocks at the cliff base, divers have to jump 27ft out during their 118ft descent. Diver Raul Garcia has taken this leap over 35,000 times.

You begin by setting the height of your dive (the higher the easier). You start by pushing the button and holding the joystick in the direction that you require the most velocity. After leaping you must push your joystick forward to arch your

The Commodore 128

...so powerful, it's 3 computers in 1

It's a productivity computer!

The Commodore 128 will amaze you with its new generation of powerful yet easy to use productivity software. Like 'Jane', which allows you to follow simple symbols instead of typing complicated commands. And because it's so easy to learn, you'll have the 128 working hard in minutes! You get 128K of RAM, both 40 and 80 column displays, and 16 colours for graphics.

It's a family and education computer!

Switch to Commodore 64 mode and you can use more than 3,000 software packages proven on the Commodore 64, The World's No. 1 selling computer. That's power – power for studying, word processing, education, home accounts, programming, fun and games and much, much more.

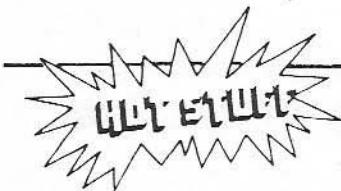

It's an advanced business computer!

The Commodore 128 lets you use software packages like Wordstar, dBase II and Supercalc, all in 80 columns. The Commodore 128 gives you all the computing power most businesses will ever need now or in the future.

Power without the price. \$699.

back and thus move further out from the rocks during the descent. Before you enter the water you must pull back to straighten out and complete the swan dive. To avoid hitting the rocks at the bottom of the ocean you must immediately move left after entering the water.

Slalom skiing

The setting for this event is Chamonix, France, where the first Winter Olympics took place in 1924. Slalom courses are designed as a test of reflexes, agility, precision and control.

To begin the course you push the fire button. By moving the joystick left or right you control your skier's movement, and by holding the fire button you increase your speed and turning sensitivity. You must pass through each gate (no easy task) on your way down. There is a five second penalty for every gate missed. Sharp turns slow you down so you must keep your speed and turning ability moderate as you race down the slope to try and beat the opponent's score.

Log Rolling

Log rolling brings a visit to Canada, where two lumber-jacks try to dislodge each other from a large floating log, spinning it back and forth until one contestant plunges into the icy river. Needless to say this sport requires great balance and agility.

You may compete against the computer or another player in this sport. The movement in this is basic. Move the joystick left and right in time with your feet and with your opponent's feet. By pushing the button you can slow the roll and change the log's direction. (This event is extremely hard.)

Bullriding

Bullriding is the most dangerous event in rodeo, a sport born over 100 years ago in the west of America, when cowboys challenged each other to contests of riding and roping for entertainment. The rider sits bareback on a wild bull weighing over 2,000lbs, and holds onto a rope to avoid being thrown.

To choose which bull you ride, move the joystick forward or back (if you feel lucky or like a fool try 'Earthquake'). You must respond to the bull's movement. If he bucks you hold the joystick in the direction that he bucks. If he spins you must hold back while he spins around. When he halts you must move the joystick in the opposite direction to the way he is facing.

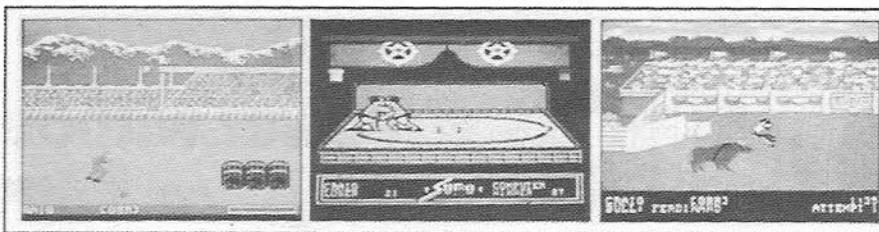

Caber toss

The heather-splashed hills of Scotland are the birthplace of the ancient caber toss. In this famous event from the Scottish Highland Games, athletes throw a tree trunk the size of a small telegraph pole. Cabers vary in size. The Braemar caber, one of Scotland's greatest challenges, is 19 ft long and weighs more than 120 lbs.

To run with the caber, move the joystick left and right in rhythm with the athlete's feet. To gain speed increase the tempo of the rhythm smoothly. To plant your feet and throw the caber, press and hold the button. As the caber pivots in your hands, release the button to complete the throw. If you release too soon or too late the caber may not flip correctly.

Sumo wrestling

Sumo is an ancient Japanese sport with many traditions. Two huge wrestlers grapple in a clay-surfaced ring, trying to topple each other to the ground or push each other out of the ring. Japanese boys must weigh 160 lbs at the age of 13

to enter sumo apprenticeship, and todays pro's often weigh 400 lbs.

You have a variety of moves you can do by moving the joystick in different directions with or without the firebutton. The computer maintains stamina and balance factors for each wrestler.

Overall views

The background views are very good, but not many of the other graphics come up to this standard. The crowds in the background remind me of the crowds in *Summer Games* on the C64. Some of the contestants are very good, but most aren't. The characters in bull riding are of pretty poor quality (considering the capabilities of the Amiga.) One amusing thing was in Weightlifting. If you didn't drop the bar

your lifter's face would slowly turn a darker shade of red, finally ending with you falling through the floor and the weight falling on your head.

The music is only of C64 standard with the same dreadful sounding instruments. The sound effects aren't even really of C64 standard. I think that Epyx should spend more time investigating the sound chip of the Amiga.

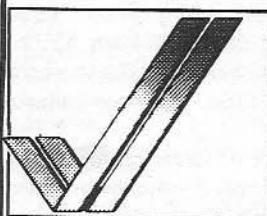

Conclusion

Not a game which uses the full potential of the Amiga, but it still is a good effort. The first games for the 64 weren't even up to the same proportionate standard.

Trivial Pursuit

by J Mark Hunter

Question: How many copies of "Yoko Ono: Absolutely Live!" were sold at the time of its release in November of 1986?

Answer: If you didn't even know she'd released one, then you shouldn't be choosing question from the arts category. Besides, like everyone else out there - you didn't buy one. None.

Question: How old was Dick Smith when he first ran away from home and called it an adventure? Part B: where did he go?

Answer: Twenty-three. Front porch steps.

Question: When was the first time that The Dead Kennedys used the Melbourne Symphony Orchestra on their Australian tour?

Answer: After Elton John, before Neil Sedaka.

Question: What would have been Billy Joel's chances of getting Christie Brinkley a wife if he wasn't rich and famous?

Answer: As good as yours.

Question: How many koalas have pooped on Japanese tourists in the last two fiscal years? This does not include the San Diego Zoo.

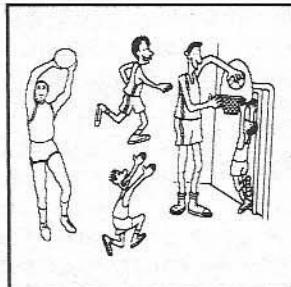

Answer: Six thousand and twelve.

Question: What is the latest opening act for the Taronga Zoo sea lion show?

Answer: Andrew Farrell computer seminars.

You can't go more trivial than that!

Trivial - insignificant, unimportant, trifling, petty, paltry, measly, slight, picayune: ("of small value"), (it's a word). Trivial from the Latin "TRIVIALIS of the crossroads', three via roads, to signify

places you see, pass, etc. everyday; something commonplace.

Pursuit: ie. 'one wedding carnation for each of the groomsmen pur suit.' From the Latin PRO-forth and SEQUIT - to follow.

So the essence of it then is to 'go after something of small value' - like a teenybopper's phone number, Jimmy Carter's autograph, The Bay City Roller's Collection.

This game from Domark on computer and on the shelf now, is a fulfillment of the title - not much scratch, stick to the board game on the shag pile in the living room in front of the TV around the peanuts and chips on a Friday night with your cousin's friends and a 2MMM commercial-free hour and a half on the AIWA. (I'd just like to say at this time that I do not get financial kickbacks by these companies for free plugs, they're just part of our last-quarter-of-the-twentieth-century vocab. Mine, anyway.

What they tell us is that *Trivial Pursuit, the Computer Game* is a "faithful reproduction of the original board game" but "with many enhancements and features to make it even more fun to play."

...Na, I don't agree, pal. Listen, I had it on over at Farrell's house - he lives in an old Wang monitor case in an IBM dispatch depot near the airport - and as soon as he saw me with it he ripped it out of my hands and jabbed it into his drive - the disappointment set in like springtime frost on the broken, rusted roof of a Himalayan goat shed. It was to sum it up in one word - corny and stunted.

They continue, "the program has been designed to be as friendly as possible and is largely self-explanatory."

... Okay, (I hold up my hands in a gesture of mild surrender), that part's fairly true, though I think the Genus II edition was a bit pushy.

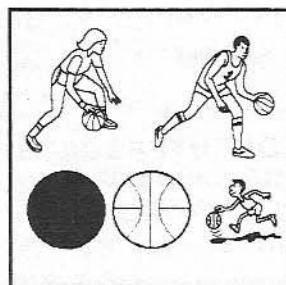

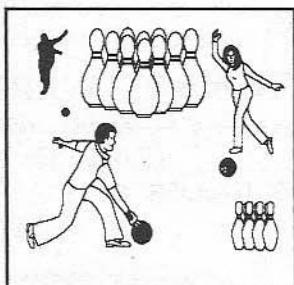

The object of the game is that the winner is the first player to return to the central hub and correctly answer a question in a category chosen by the other players. Before attempting a game winning question, a player must land in each of the six category headquarters and correctly answer a question.

If you've never played this game before, here's a rough assessment. A player throws a token to the board and it lands on a designated square symbolizing a category from which he must answer a question. On the screen version the token is a computerized "dart" or icon.

If the player answers correctly, his or her turn continues. If the answer is wrong the turn moves to the next person on the list. When the player is in a category headquarters (at the end of a spoke) and answers correctly he is given the appropriately coloured scoring wedge. If the player lands on the grey "throw again" spaces, then a further throw is given.

If a token lands on the hub before it is full of wedges, then the player may choose any category of question. This is done by moving the joystick and highlighting the subjects below.

Once a player has his wedge full of six tokens or token full of six wedges whatever comes first, he makes his way

NetComm believes Commodore owners have waited long enough.

It seems Commodore owners are a patient lot. While other PC users were discovering the delights of communications, you had to wait for someone to design a modem just for you. And while the others were enjoying the convenience of auto dial and auto answer, you were left waiting again. But now, with the introduction of NetComm's Modem 64/128 for Commodore, your wait is over.

The Modem 64/128 is a full-feature, two-speed auto modem compatible with all existing commercial and public domain software, including Commodore 1650 software.

It operates at 300/300, 1200/75 and 75/1200 baud.

It comes complete with Videotex and Terminal software and even a VIATEL subscription form.

It provides auto dial, auto answer and auto disconnect features you'd only expect to find on much more expensive modems.

All modem features are software controlled, with a full 7-LED display reporting all operational modes.

And it comes complete, with Telecom approval, ready to plug in and run.

All this, plus NetComm's legendary reliability, for less than \$300, excluding tax.

So now, what are you waiting for?

NetComm

NE41 FPC

toward the central hub, and must land exactly on the hub. Once there, the other players choose the category of question to be answered, and to win, this question must be - you got it - answered correctly.

When you've got *TP CG* loaded... (*Trivial Pursuit Computer Game*), the first thing to do is to type in each player's name, you can have 1-6 players. Then you have a number of options. You can edit names (if someone makes a mistake or someone joins, leaves or wishes to continue the game), set a time allowance for answering questions (between 5 seconds and 9 minutes), and decide whether or not to include "TP" (the little ikonfaced dude that bounces around the game on the screen) within the game.

Sound effects can be turned on or off - that's two options, and the sound effects are pretty hopeless so I turned them off and played Springsteen's "Nebraska" instead - just as monotonous. You can load automatically a new block of questions and importantly, check the place of each player on the score screen. These can be chosen by moving the highlight bar up or down and then pressing the fire button.

Once you have decided on your options simply highlight the "New Game" choice on the menu and press fire to enter the game.

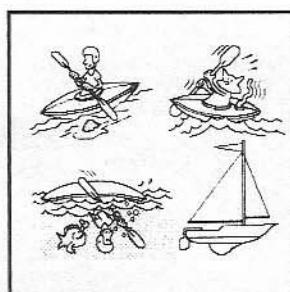

You will find yourself on the board screen with "TP" waiting for you. From here onwards movement through the game is controlled by the joystick or keys. To move on in the game you have only to press the button. At several points in the game you are asked to make choices. Just move the joystick or press the keys in the required direction and press fire to continue.

Whether "TP" asks you a text, music or graphic question there is no need to type in the answer. Simply say your answer out loud and press the fire button to see if you were correct. Just as in the board game, it is up to all the players to decide whether the answer is near enough.

When the questions contained in the main programs are used up you can use new questions from the "Unilogic Question Pack" on tape/disk.

One special feature of the computer game that does not appear on the board game is the Score Chart. Before throwing a dart you can return to the option menu and by choosing "Score Chart" you can find out how you are doing. Are you answering more questions than your opponent? Is she or he better at sports questions than you? All this is worked out and shown to you by the computer.

When it gets to the point that one of the players has arrived at the centre hub you can, by pressing the option key, see their analysis chart and pick their worst subject for them to answer.

And, if your cousin's friends are not around or you're shut up in a Himalayan goat shed during a blizzard by yourself, you enter only one name into the list at the beginning and you are automatically into the one player mode. You must answer the questions as quickly as you can and try to complete the game. The computer will time you and keep a record of your answers. At the end you will be given a score based on your performance.

Graphics are nothing superb, babes, let me tell ya. The colour squeezes into the same category and as mentioned before the sound is bland and decrepit.

It's okay to play, but could have been made a little more adultish and faster moving. It's kind of neat, I guess, if you're into computers, and want to impress those friends of yours that aren't, but are into *Trivial Pursuit*. It's a novelty, but soon wears off and hits Yawn City limits by late evening.

Final Question, then: What happens if you do suddenly find yourself in a Himalayan blizzard and there's no goat shed?

The Answer: "Scream and Die" is close enough.

Defender of the Crown

by Stephen Gordon and Shane Watts

Well, we can hardly believe it. It's here. We saw some of the graphics at United Computer in Sydney in December. We were very impressed. We're the first one on our block with it and it's a winner. We must confess that we are the only one in our area with an Amiga but we consider that irrelevant.

In case you have never heard of *Defender of the Crown* we must tell you a little about it. The publishers call it Cinemaware; in other words it's like a motion picture. There is some similarity; the pictures are very good and some of them do move.

With this game you need to know how to read but not how to type. Everything is done with the mouse. The opening screen is one of the most impressive; a metallic gold title that shines while the stereo music plays. The game that really shows off the Amiga. An indication of the talent

behind this game is that the pictures were done by James Sachs - you know, his name is in the corner of many of the Public Domain pictures around the place. R J Mical, the author of a major part of *Intuition*, did much of the programming.

After the title screen it gives you some history. The game is set in the age of chivalry, the time of Robin Hood - an important character in this game - a time of knights, castles and fair maidens in distress. These are all important elements of this game of strategy, conquest, jousting and swordplay. In case you haven't guessed, this is a male oriented and somewhat adult game.

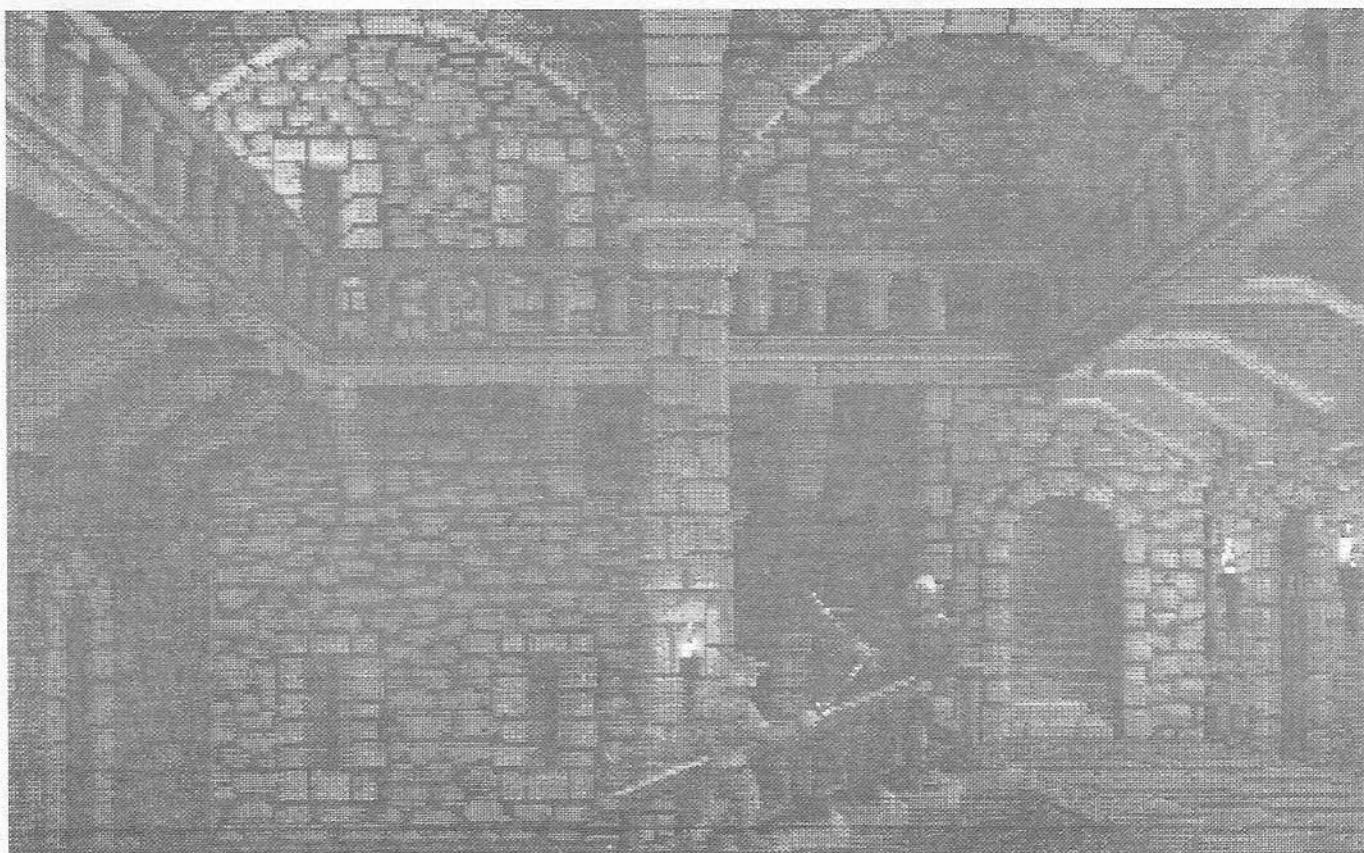

The first of many choices is which of the four Saxon lords you wish to become. You are given a list of talents that each has. For example: leadership, swordsmanship, and jousting ability.

The object of the game is to increase your fortunes and lands by waging conquest and raids upon the neighbouring territories owned by Norman and other Saxon lords, and ultimately to capture the three Norman castles and be crowned the new king.

You must learn to fight with sword, lance and catapult. You will lead armies of knights and foot soldiers. How well you lead and fight will help to determine the final outcome.

Of course, as in most games, luck plays an important part in *Defender*. A band of thieves may attack the sheriff's tax collector, thereby reducing your income. While you are out raiding and pillaging, your home castle could be put under siege.

At any time you may be asked to rescue a captive Saxon maiden. If you are fortunate enough to rescue her, your

AMIGA COLUMN

reward will be most pleasant. This is where the "adult" that I mentioned before comes in. I'll leave what happens next to your imagination.

Now I mentioned swordsmanship, jousting and catapults. This is where the "motion" comes in. When you sword fight, you move the man on the screen and his sword. You can lunge and retreat, parry and thrust. You are in control.

The tournaments are most impressive. Trumpeters, banners waving, crowds smiling and nodding in the stands, horses restless and waiting. It's all there.

You choose an opponent and then the real action begins. You have very little time and you must be very accurate to unseat the other horseman galloping toward you. I have yet to win a joust. Of

course I keep choosing the best swordsman. Just one hint: He has the best chance of rescuing the fair maiden.

At first Stephen thought there was too much repetition of graphic screens until he realized that if there were more different scenes the program would have taken more than two disks, and disk swapping is more distracting than seeing the same castle interior. It is recommended that you play the game in the dark and I agree. It does give it a more movie-like feeling. And since there is no typing needed, you really don't need the light.

Though we were really impressed with the quality of this game, we were certainly not impressed with the packaging. The very first thing Shane noticed when he picked up the box was

the rattling. There are two disks for this game and they were both just loose in the box. The box is too big for its contents. The beautiful illustrations on the cover of the box could just as well have been on one of those folder type diskette packages that hold the disk in place. The slim booklet giving history, background and instructions for the game would also easily fit in the same folder.

Review copy was supplied by United Computers, 207, Clarence St, Sydney NSW 2000. (02) 29 5088

Also, on the way are three new Cinemaware programs. They are: *King of Chicago*, *SDI*, and *Sinbad and the Throne of the Falcon*.

These programs are said to be as good as *Defender of the Crown* and they live up to the Cinemaware name.

SHERWOOD FOREST

Are you visit your old friend Robin of Locksley. Many years have passed since you served with Robin and his men - but disastrous news curtails the reunion.

During your journey, an assassin took the King's life. The Kingdom is in chaos because there is no heir to the throne. Worse still, the crown itself has disappeared.

**If you own an Apple IIc,
you'd have to add all this**

**to match the versatility, expandability
and higher intelligence of the
new Commodore 128
(and it costs less too).**

The new Commodore 128™ personal computer is breakthrough technology at a breakthrough price. It outshines the Apple® IIc in performance capability, performance quality and price. It is expandable to 512K RAM while the IIc isn't expandable at all.

And the new Commodore 128 has a numeric keypad built right into its keyboard that makes crunching numbers a lot easier. And the Commodore 128 has graphic and sound capabilities that far exceed those of the Apple IIc. But the most important news is that

the new Commodore 128 jumps you into a whole new world of business, productivity, education and word processing programs while still running over 3,000 programs designed for the Commodore 64.™ That's what we call a higher intelligence.

COMMODORE 128  A Higher Intelligence

DEACTIVATORS

by J Mark Hunter

It's what you call - deactivation. Stopping, ending, defusing something about to occur.

Video entertainment now, from ECP.

A group of fanatical saboteurs have infiltrated the Gravitational Research Institute and planted numerous time bombs throughout the five laboratories. They have also programmed your robot guards to act against you.

As head of security you must call in your elite force of Deactivator Droids to clear the bombs and repair the computer.

They will have difficulty moving from room to room as floors may be ceilings and ceilings may be walls. Also, the rooms have different gravities. The Deactivators are your last hope to save the institute from destruction!

The aim of the game is to remove all the bombs from five different buildings. You start on level one in a four by four building. The displays at the top of the screen provide a view of what's going on in two adjacent rooms. At the bottom of the screen is a map of the building showing you the position of the droids and bombs. Each droid is restricted in the number of rooms it can move between. Your score is shown in the box on the left, and any bonus droids you have available. The status box on the right shows whether the droid you are controlling is carrying either a bomb or a circuit board.

To remove the bombs from the building you will have to carry them to the exit and throw them out. There is not

always a direct route out of the building, so you will have to throw the bomb between a number of droids to remove it. The exit room is the only room with a door which leads to the outside. Certain elements in each building will not function until you replace the corresponding circuit board in the computer room. These include lights, matter transmitters and door or window openings. Some circuit boards are dummies and have no effect and others switch off obstructing forcefields.

You can move around the building in a number of different ways. Through the doors, dropping through the hatches, sliding up and down poles, or using matter transporters.

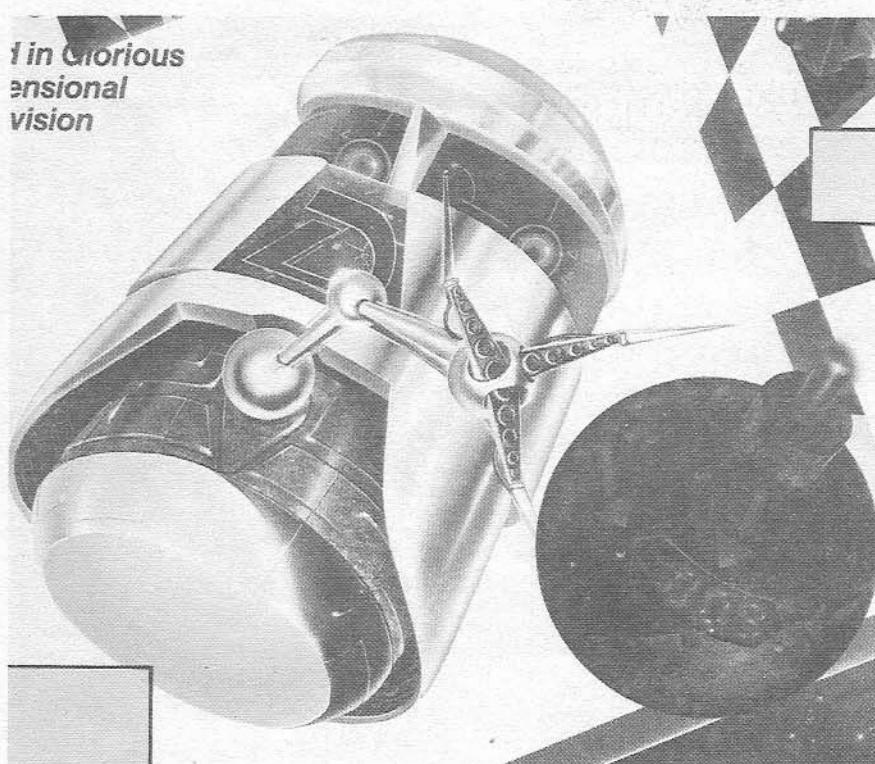

Once the game has been loaded you will see the opening screen. From here you will be able to select either beginner or advanced level. On beginner level you have slower guards, more time and more impacts before the bombs explode.

When and if you manage to remove all the bombs from a building you will be placed at the start of the next level.

When a new level starts you will be placed in a droid select mode. Don't be scared, it doesn't hurt.

This is shown by the flashing highlight on the screen map. By moving the joystick left and right, the cursor can be moved all over the available droids in the building. Pressing the fire button selects the droids.

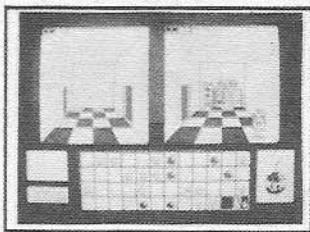

When in droid movement mode, left and right on the joystick moves the droid in those directions relative to the floor. Up moves the droid to the back of the room and down brings it forward. Pressing the fire button opens up the control icon window which acts as a game play pause. Any bombs being carried by your current droids will continue to fizz, but time is frozen until you return to the movement control.

All the bombs in the building are set to go off in sequence. If you are carrying an active bomb you will see the fuse burning in the status display. Be careful when throwing a bomb through a window or hatch, try and position a droid on the other side to catch it. When the bomb passes into a new room, control will automatically be transferred to the new droid.

Circuit boards need to be replaced in the computer room to restore the function of certain elements in the building. There is only one computer room per building. To replace a circuit board, move your

droid over it. To throw, press the fire button to open up the control icon window and select the bomb throw icon by pressing fire. The display will be replaced by a trajectory meter showing the angle and direction at which the throw will be made.

When it comes to the robot guards doing their routines they will only chase after an active droid if they are in the sector of the building. If you go out of the sector, they freeze. Guards can be destroyed only by making them fall through hatches within a short space of time. If a guard makes contact with an active droid, the droid will disintegrate. If the droid is carrying a bomb, then the bomb will explode.

As well, because of the nature of the research being carried out in the buildings, each room has an individual gravity generator. These have been set to one of four strengths and the rooms have one of four orientations.

Points are scored for collecting and replacing circuit boards but more importantly, for the speed with which the bombs are taken to the exit.

We got the needle drifting into the fun zone here, yes, and quite wetted by the enjoyment factors involved. *Deactivator*. Read the bold type and the fine - it all comes out the same - impressive, inducing nods of approval, at least in this room.

Graphics, spelled with capital good, small case brilliance. And sound, and music and the colours on the screen - as above.

Value for money, if you've got any after the Big 25. Worth the trip to the store and the wear and tear on your C64.

I mean, you gotta buy it now - cos the Claus in the Christmas contract has between totally deleted.

Amen.

NEW!! NEW!! NEW!! COMPU-CONTROLLER

Finally a product to really make the home computer useful in the home

This elegantly designed unit will work on the VIC 20, C64 and C128.

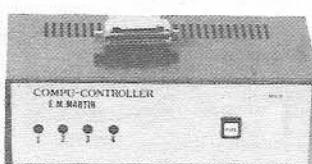

*Plugged into your computer and the mains it gives you four power outlets that you can turn on and off from your Commodore.
* Set it to turn lights, radio, TV etc on and off while you are away from home.
* Connect sensors and detect burglars and turn on lights, alarms, etc.

ITS USE IS ONLY LIMITED BY YOUR IMAGINATION
The unit comes complete with a program disk or cassette (please specify) for immediate use. Example programs are also given to enable you to write programs for your own application.

Infocom Four in One Sampler

Part II

by *J A Salt*

As promised I would like to share with you my attempts to play the excerpt of *Planetfall* which is featured on the INFOMCOM-FOUR-IN-ONE Sampler disk. (Readers interested in Part 1 should obtain a copy of Vol 3 No 12 of this publication.)

The main aim of this series is for us to progress through the 'sampler' disk together. By doing this, you allow me the opportunity to share with you some of the basic fundamentals that I have discovered in my many efforts to tackle various adventures. By sharing our experiences, I am hoping to encourage you to persist in your initial efforts which can be very daunting to a novice adventurer.

Planetfall is a science fiction adventure written by a very successful member of the Infocom team, Steve Meretsky. It has been given a STANDARD classification for its degree of difficulty to play. The STANDARD level is Infocom's most popular level of interactive fiction and can be enjoyed by both novices and experienced players.

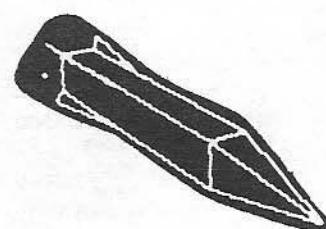

In this excerpt, which has been extracted from the full length version of *Planetfall*, your goal is to find a way to CROSS THE GAPING RIFT in one of the corridors. Your starting location is at the CORRIDOR JUNCTION (with a 6 POINT start).

When you have completed the exercise offered to you, then and only then, compare your efforts with the result of my first few attempts during which I familiarized myself by mapping and examining the locations as I entered them.

(10 points/29 moves)

```

You will note that both examples successfully completed the exercise. However in my second example I was able to do it in 29 moves. The point I'm wanting to make here is for you to be aware that an adventure can be explored in more than one way and still be completed with a great deal of satisfaction for the player.

Obsessive players like myself get a greater sense of achievement in the challenge of perfecting our game by retracing and refining our moves so that our ultimate score is achieved with as few moves as is possible. Saving at different stages of your venture is important for you to succeed. (As this disk does not have a SAVE program on it, I will cover the advantages of SAVING in a later issue when we explore a FULL Length adventure.

Try hard not to complicate a game for yourself. Map your locations as you reach them. Jot down any objects you come across. Read carefully all descriptions and directions given to you on the screen. If you are unsure of which items to take when you enter a new area type "TAKE ALL" and you will be told what can and can't be picked up. Whether you will need these items, only further

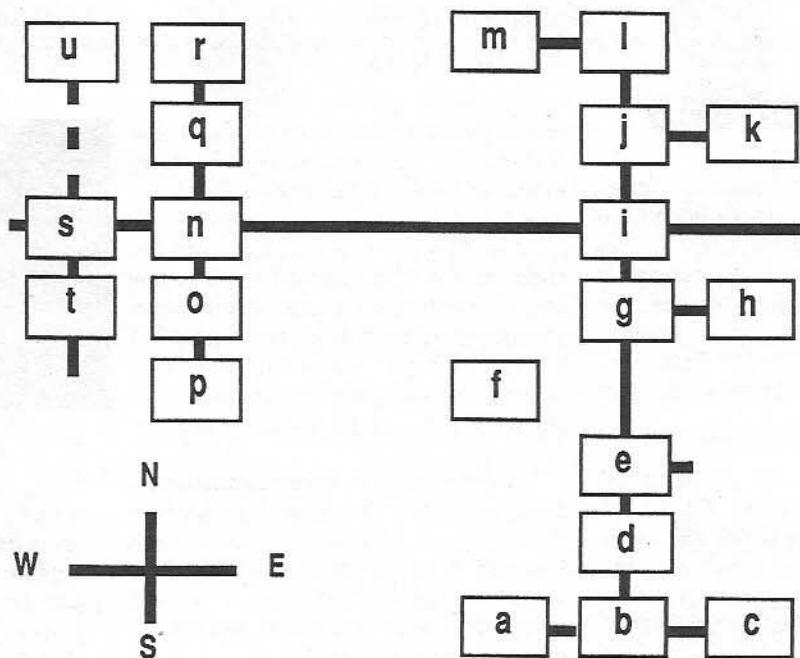

progression into the game will tell. Don't be scared to examine objects found. Open cupboards or desk drawers, press buttons, pull levers, look under bunks. In fact a true adventurer has to have the curiosity of nine cats.

Think of a text adventure as you would if you were going to climb Mt Everest. Every step taken in the climb is an unknown and everything that happens until you reach the top is unexpected.

In a later issue I will give details and a map for the INFIDEL excerpt. I hope in the meantime you will have attempted and enjoyed playing it for yourself. Happy adventuring.

Adventurer's Realm

by Michael Spiteri

Welcome once again to Adventurers' Realm. Many apologies to those of you who had to wait weeks for a response to your letters, and apologies again for the reduced size of this month's Realm. It is all because I have moved into a new cave, and all the letters, programs, etc, are in boxes. Don't worry, things should be back to normal by March's Realm. Please note the new address as well!! This address is just temporary until I can get hold of a P.O. Box that will hold all your letters!!

The address to write to is:

Adventurer's Realm
2/12 Pine St
Hawthorn VIC 3122

or

Adventurer's Realm
20 Larool Crs
Seaford VIC 3198

Also, the VIATEL service is no longer available, and I apologise (again) if you have sent mail to my mailbox and received no response.

New Releases

From the makers of *Borrowed Time*, comes *Tass Times*, a wacky adventure set in a town run by every animal under the sun. A land where your pet pooch is the famous canine reporter for the Tonetown Times! A supy zany graphic-animated adventure from Activision should be available by the time you read this.

Recently released is a game called *Dracula*, a graphic/text QUILLED adventure based on the famous novel by Bram Stoker. Great atmosphere, fair vocabulary, this game could prove to be quite popular. I am still in the early stages of the game, but I promise a complete

CHARTS - CHARTS - CHARTS

Australia's Top Ten Adventure/Strategy Games

- 1) LEATHER GODDESSES OF PHOBOS - Infocom
- 2) ASTERIX - Melbourne House
- 3) THE PAWN - Magnetic Scrolls/Rainbird
- 4) HITCHHIKER'S GUIDE TO THE GALAXY - Infocom
- 5) SILENT SERVICE - Microprose
- 6) LORD OF THE RINGS - Melbourne House
- 7) SECOND CITY (MERCENARY II) - Novagen
- 8) TRINITY - Infocom
- 9) ULTIMA IV - US Gold
- 10) ELITE - Firebird

Don't forget to keep sending in your favourite adventures.

review in one of the future issues of *The Australian Commodore Review*. Produced by the British firm CRL.

The Pawn is finally available in the shops for the Commodore 64. Just a few comments about the game: the graphics are incredible (and as close as possible to the Amiga version), the text descriptions are good, the vocabulary is not so good (....as the Infocom vocabs).

Twice Shy is the newest revolutionary program from the guys at Mosaic Publishing. Based on the book by Dick Francis, it is not only a graphic/text adventure game, but also a betting game, featuring animated graphics. Horse punters will love it!!!

Interceptor Software have been pretty quiet since the release of their *Heroes of Karn* adventure series a few years back. Now they have returned with a game that deals with surviving after a nuclear war. *After Shock* is a animated graphics/text adventure game, and should be available in Australia shortly.

Problems

A dude called **SHOGUN II** is stuck in *Terrormolinos*. DOWN STEPS is the command required to climb down the steps, but how does he enter the taxi?

Brad Ashwood of Jindalee, QLD, wants to know how to get the herbs from the garden in *Macbeth*, and wants to know where he can find some skis in *Aztec Tomb - Revisited*.

Can anyone help **Tony Cupitt** and supply him with a list of spells for *Ultima IV (Quest of the Avatar)*?

Craig McFurlane is stuck in *Treasure Island*. Does anyone know how to get the drunken sailor away from the ship's wheel?

Warren Romeo wants to know if you can pass the bog near the spiders in *The Hobbit*?

The Adventurer is stuck in many adventures. In *Red Moon* he cannot cross the chasm. In *Never Ending Story* he cannot fly Falkor, even with the thing he wants, and finally, in *Himalayan Odyssey* where is the eye and what's the paint for?

Sean of Viatel 270561600 cannot enter the tunnel in *Never Ending Story* and cannot escape the trees in *Bored of the Rings*.

Justin Prime is stuck in *Colossal Caves*. How does he get the ring from the dragon and how does he get the pirate's chest from the vending machine? Also, in *Borrowed Time*, how can he get the paper from Lebock's house and what post box does he need to open?

Dorothy Millard of Croydon, Vic, is having trouble in *Circus Adventure*. She cannot use the petrol syphon. In *Jewels of Babylon*, how does she use the watch to get past the cannibals?

Mrs Ellen Budden solved most of the problems sent in by readers over the last couple of months (see further down), but she is also stuck in a few games. In *Skull Island*, cannibals are preventing her from leaving the place. In *King Solomon's Mines*, she has a canteen that empties itself. In *The Hobbit* she cannot find a key that fits in the small door in the mountainside. In *WarGames* she cannot get through the sliding doors. Finally, in

Castle of Terror she cannot seem to find the flint.

Nicholas Blair is stuck in *Red Moon*. He cannot get past the room of flashing lights.

A **Harpy** (?) is preventing **Mark Sutton** from getting anywhere in *Catacombs*.

Vivienne Slater cannot avoid a sudden death with a shark in *Nine Princes in Amber*, and she wants to know how to defeat the Green Knight in *Lord of the Rings*.

Jamie Kennon is stuck in *Ballyhoo*. How does he get into the meeting in the trailer? How does he move the old plywood sideshow from the Menagerie Nook? And why is the cat hiding under the bed?

Steven Suthers (supplier of *Hunchback* map) is stuck in *Worm of Paradise*. Where can he find the valve?

Ann Brownell is stuck in *Robin of Sherwood*. Where is the silver arrow? How does she enter the castle? Where is the key to the castle door?

Answers

Ellen Budden kindly sent in solutions to many of our readers' problems.

Bastow Manor (for **Michael Davis** and **Andrew Kidd**).

Q. How do you get into the study? A. You need the brass key.

Q. How do you open the door at the other end of the corridor? A. You don't. It's a red herring!

Q. What's inside the apple? A. It contains a small key which opens the small box which contains the combo.

The Hobbit (for **Ben Creek**).

Q. How do you escape the bulbous eyes? A. Wait twice before moving.

Aztec Tomb (for **Unknown adventurer**).

Q. How do you get the map? A. Exchange it for a cloak (see the gnome/elf in treehouse).

Q. How do you get up the cliff? A. When in boat next to cliff, JUMP OVER and SWIM and GO BEACH.

WarGames (for **James Elstob**)

Q. How do you get the shiny object? A. Wear the gasmask (found after sickbay).

Q. How do you escape from sickbay? A. You need scissors, screwdriver and gloves (worn). LEVER PANEL and then CUT WIRES. Scissors can be found under the pillow.

Skull Island (for **Steven Woolhouse**)

Q. How do you get off the beach? A. Go to lion rock, PACE 15, then DIG (with shell). LOOK and you'll find some ROPE. Tie rope to anchor.

Murder on Waterfront (for **Steven Woolhouse**)

Q. How do you order food from the restaurant? A. Try SIT TABLE, then

ORDER MEAL (or FOOD).

Q. How do you get past the undertaker? A. You have to go through his back door.

Hampstead (for **Martin Trommer**)

Q. How do you get out of the complex? A. n.e.e.ne.e.e.ne.n.sw.

Meanwhile, **Dorothy Millard** lends a helping hand:

Smuggler's Inn (for **Di Vernon**)

Q. How do you operate the TRAPDOOR. A. TURN RING, then OPEN TRAPDOOR.

ZORK I (for **Andrew Kidd**)

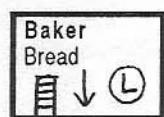

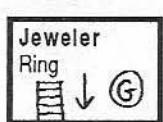

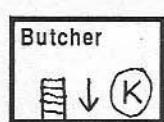

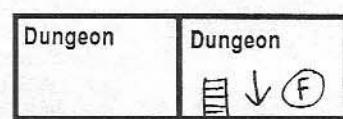

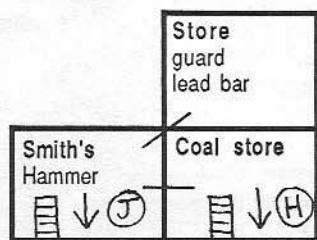

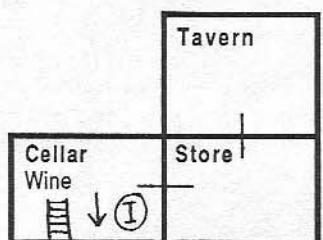

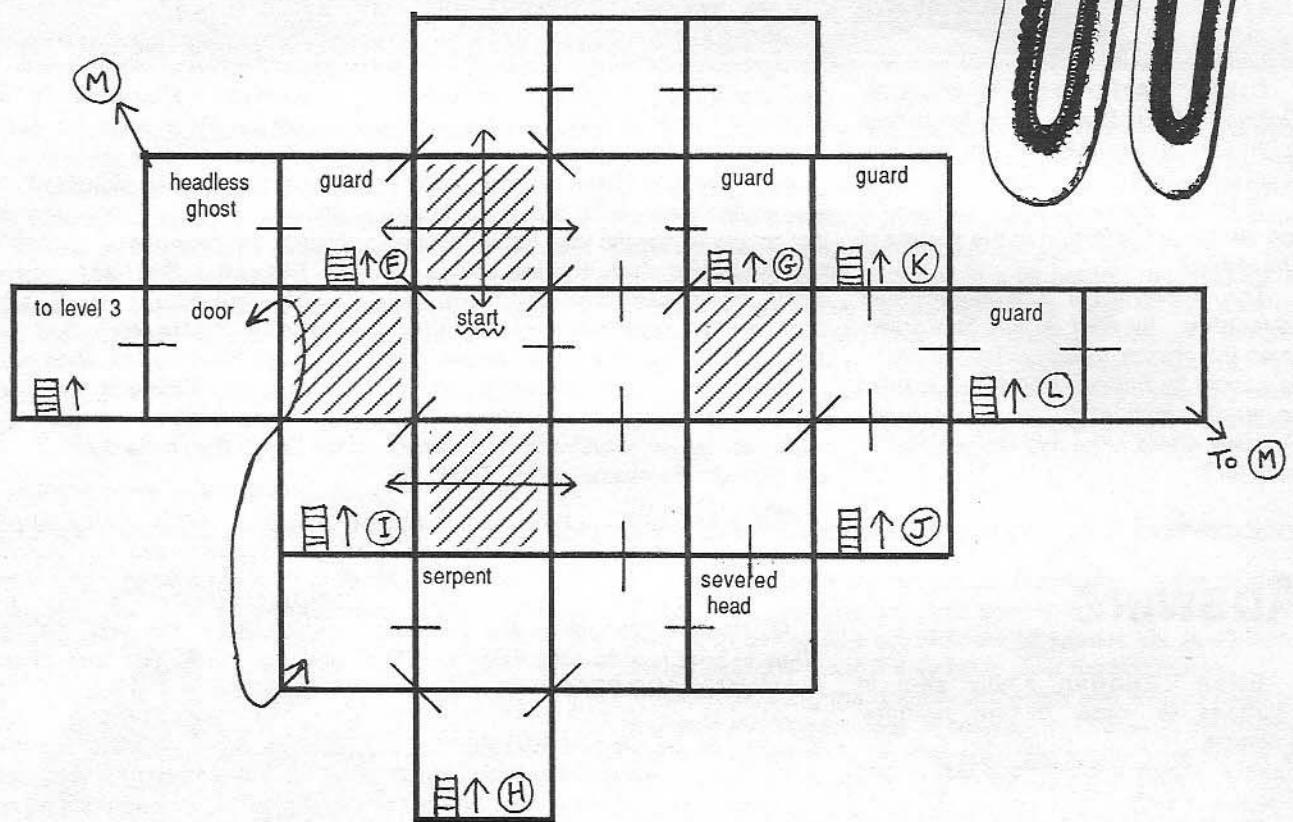

Q. Where is the garlic? A. In the sack in the kitchen.

Thanks to all who offered help with the Garlic in *ZORK I*.

That's all for this month. I promise a much much bigger Realm in March.

The Sewers

Upstairs rooms.
The letters next to the arrows correspond to the letters in the sewers.

Scribble! Version 2.00

A good word processor for the Amiga

by Stephen Gordon and
Shane Watts

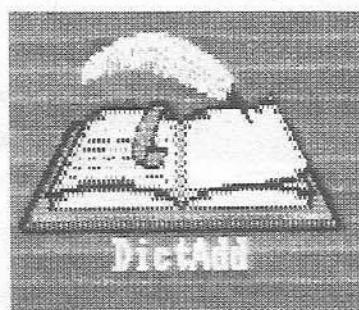

After using *WordCraft* on the PC-10 for over a year, it's interesting to start using different word processors. So when we got a chance to try out *Scribble!*, we were ready for a change. As is usual when changing programs it took a while to get used to the differences. In fact Shane is still trying to complete the transition.

After reading the small but generally complete manual and the documentation files on the disk, you can just jump in. If this is your first experience with a word processor you might want to go through the tutorial chapter. Be aware though, this is a really "basic" tutorial. If you have ever used any word processor before you can probably just skim this chapter. There are three files explaining (1) changes for this version (2.00), (2) the new Spell feature, and (3) the MailMerge feature. I have not used the earlier version but from the documentation it appears the changes are improvements.

Scribble! runs from either Workbench or CLI. Running from Workbench is rather pleasant since the designers of this program have provided some very nice ikons. Clicking on the *Scribble!* ikon loads the program and provides a full

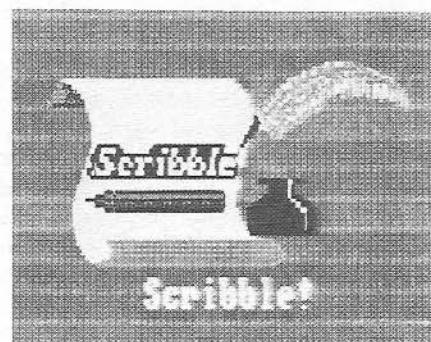

screen window to start entering text or load an existing document to edit. If you click on the Document drawer on the *Scribble!* system disk and click on one of the ikons in it, the existing document will be loaded with *Scribble!*. The creation of ikons for your documents is optional as are most of the features of *Scribble!*.

One of the options we really like is being able to select the paper and text colour from the screen colours set with Preferences. Being able to write in black or blue on a white background is more like typing on a sheet of paper. Okay,

some habits are hard to change. Practically any option that you prefer to the defaults may be changed and saved in a "Scribble!.fmt" file that will be loaded at startup time saving you from making several trivial option changes each time.

It is, I imagine, difficult to decide which tasks to assign to menus and which to the keyboard for a word processing program which is basically a keyboard task. Generally people can live with the decisions of the writers of *Scribble!* This is not a major problem for the user, since most of the menu options are available from the keyboard with either ALT, SHIFT or Amiga key combinations. In fact, the few not dually selectable are rarely used.

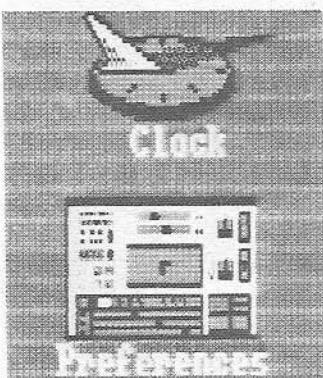

One new option is being able to use *WordStar* command-control key combinations. This is a help to Stephen as *WordCraft* also supports those combinations and he has become accustomed to using them.

The F1 key provides limited online help for the most used function. The F2 key provides a list of dot commands for page formatting. We really think the more obscure functions should be in the help screen, since the more used ones will be quickly memorized with use.

One important function is performed by the F4 key. It saves your document to its current disk file, providing easy protection from power problems.

A problem with these help screens is that they are not windows and therefore are not resizable or movable. You have to call them up each time you want them and then put them away before you can continue. Not too sophisticated. At least you can make them go away with the same keys that make them appear. There is optionally a requestor that you can click on.

This is a program of many modes, or "Actions", in *Scribble!* terminology. Each mode has a different pointer shape: **Edit** is a pencil, **-** looks like a stub to me. **Copy** is a camera, **Cut** a scissors,

Paste a glue brush, and **Style** a brush. All of these pointers, except the pencil, become a paint roller while you are selecting the text to be acted upon. Speaking of modes; Insert mode can be toggled on by ALT-I, and you are always in auto reformat mode. In other words when you insert some text in the middle of a paragraph the following text will be shifted accordingly. We like this though we are sure others will not.

The only problem we have had with the program concerns the way *Scribble!* delimits lines and paragraphs. Linefeeds are inserted only at the end of paragraphs. AmigaDOS delimits lines with linefeeds. Therefore if you try to read a *Scribble!* produced document into, say ED, it may fail because the lines are too long. Of course you can press RETURN at the end of each line, which is okay, if you are editing program source code or other fixed format files.

My problem occurs because the editor of *The Australian Commodore Review* uses ED to do some final touchup of articles and can't read *Scribble!* files directly. (Did you ever notice how many names of things relating to the Amiga have exclamation points in them?)

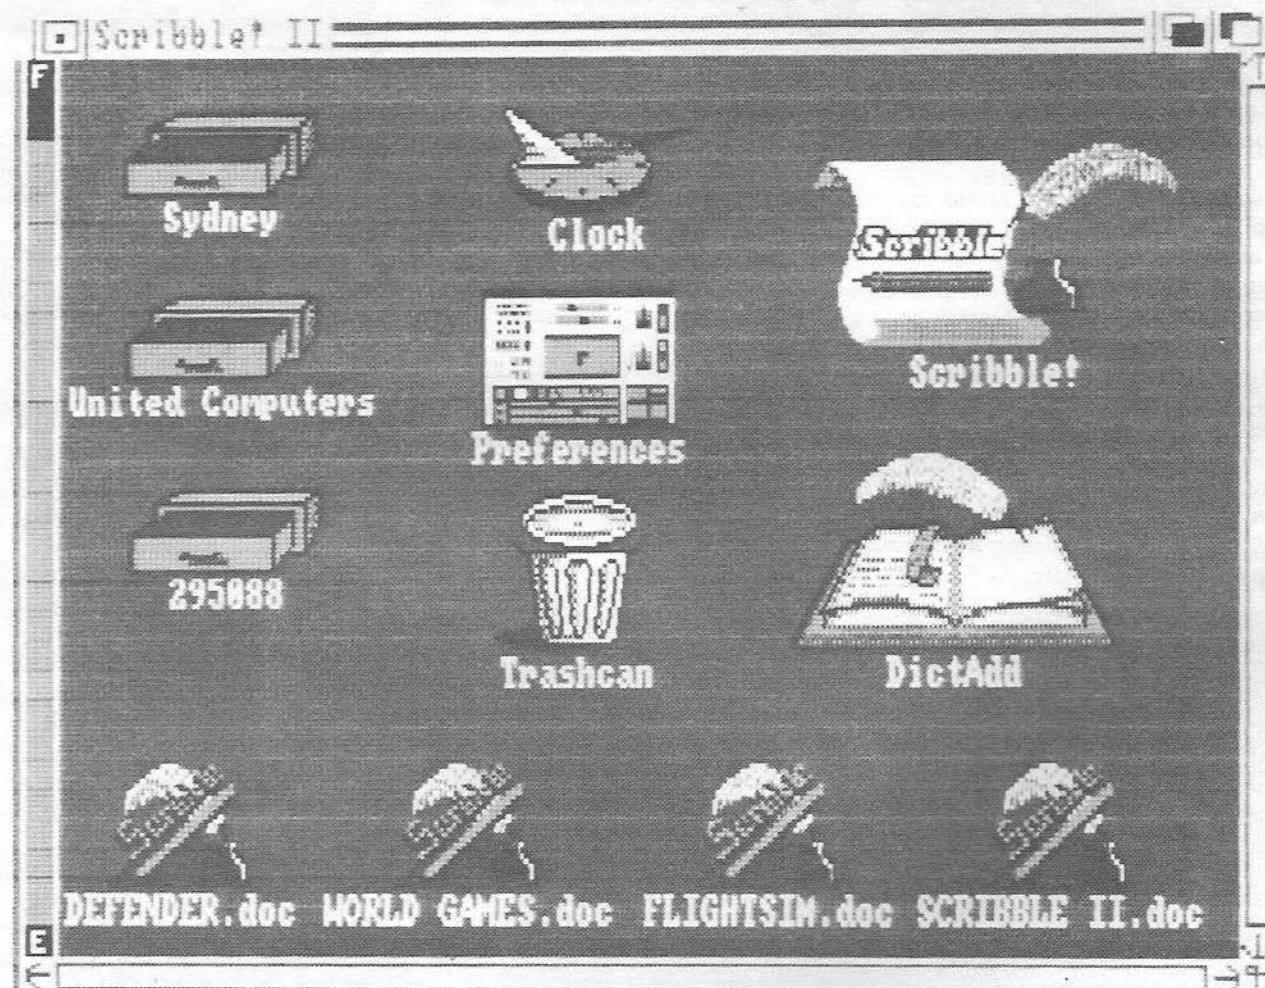

I have solved the problem with a public domain program called *TextFile-Converter* (TFC) written by Mark Allen and Ken Strange. TFC is an AmigaBASIC program that will truncate all lines in a file to your desired maximum length by inserting linefeeds and rewriting the file to a new file.

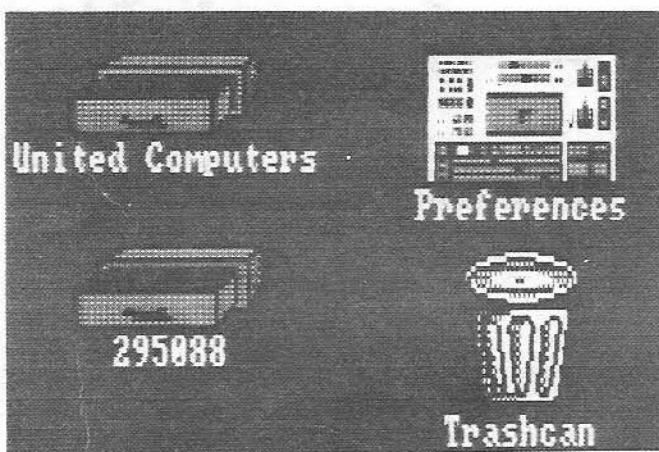

Scribble! loses its place now and then if you don't have the end of paragraph markers showing on the screen. When you type over one of these markers the following lines become part of the previous paragraph. Not a big problem but annoying. This really caused me some bother until I learned to turn them

back on by the ALT-I toggle.

Scribble! has many useful features that allow quick retrieval and storage of documents. While listing a directory, you may enter a new device or directory name and *Scribble!* will immediately start to list the new directory. Neat! In fact you don't even have to wait for it to complete its listing. When you see the file you want, click on it, click on GET and it starts loading. Now that's response! The scroll gadget is active even while the directory is being displayed.

Scribble! runs under WorkBench 1.1 or 1.2. In fact some improvements are available only under WorkBench 1.2. When a requestor is put up under 1.2 it is not necessary to click on the string gadget before you start to enter the required text. Some requestors will accept the first letter of the answer from the keyboard rather than requiring a click of the mouse.

You may work in up to four different windows, on the same or different files. The default work space size is 16K. The documentation says it will load files of over 290K using dynamic file allocation. I don't have any documents that size - my ideas for a book are not quite ready yet - so I was unable to test this. It allows you to predetermine file size in case you have problems with its dynamic method.

The new Spell Check feature is very handy. It can be used on a word by word basis while you are entering text, for a window or for an entire document. Its dictionary is not the largest I've used - that's Webster's New World for the IBM PC - but it is expandable as you use it. Eventually it will learn all of the computer terms I use. It doesn't even recognize Amiga! Not that I would ever misspell it but it picked it out of a document scan.

Scribble! allows you to put its dictionary in ram for quicker response but when I did this and tried to edit another document I didn't have enough memory (I think 512K). Of course you lucky folks with ram expansion should not have this problem. Actually it isn't really necessary to do this because the disk reads are quite fast.

The window option is just a quick scan to show you potential errors. It doesn't let you fix any of them with this option.

By the way, the spell checker is not a window either. It's always the same size and in the same position. (It shows you the word you wanted checked and a few optional spellings to choose from.) It would be nice to have it avoid the area you are checking or at least be movable so you could see the context of the word in question.

Another gripe about the spell checker is that it is supposed to recognize the roots of words when used with other suffixes. Sometimes it does and sometimes it doesn't. "Predetermines" is in the dictionary but when I checked "predetermine" which I used in an earlier paragraph it didn't find it!?

For you folk just dying to start generating your own junk mail or just need to send form letters at Christmas to all of your relatives, *Scribble!* now has Mail Merge capabilities. You type your basic letter with embedded "variable names" with the

format of &Name& wherever you need replacement. You then create a list of replacement values and save them in a file. The basic letter must contain dot commands to drive the process. For example: replacement values. You can also prompt the user for values as the letter is being typed by using .AV=Name. "Name" being the variable name used in the letter. It seems to have the necessary functionality.

Scribble! shares one problem with *Deluxe Paint* and *Deluxe Print*. The Amiga is a multitasking machine. Right? Well how come when these programs start a print task, it takes over? The print task should be a separate task so you can start working on something else or even the same document that's being printed. That's what it's all about. At least with *Scribble!* you can stop a print task if there is a problem. If you press the space bar it will pause the print and the escape key will abort the print. That is an improvement over the "Deluxe" one.

All in all I really like *Scribble!* It has some things to get used to but none to prevent it from being a useful program.

Program: *Scribble!* II

Machine: Amiga

Price: \$249.00

Publisher: Micro-Systems Software.

Distributor: Oxford Systematics

Available at: Sydney United Computers.

Cockroach Graphics Pirate

The Cockroach Graphics Pirate is a transparent cartridge for use on the Commodore 64, SX64 and 128 in 64 mode.

Any screen may be captured at the press of a button and saved to disk (including sprites and character sets). These files may be extensively edited using a powerful display editor supplied on disk or as the screens are conveniently saved as KOALA or DOODLE files, they may be loaded into these drawing programs. The sprite files are SPRITE MAGIC compatible and the character sets are ULTRAFONT compatible (public domain COMPUTE).

A ROACH-SHOW maker allows these screens to be compressed and compiled into a slide show which displays everything that was on the original screen including sprites. The Roach-Show incorporates an ultra-fast loader which will display a new screen approximately every 4 seconds without blanking. This is fast enough to allow crude animation!

Any screen displayed may be printed out (including sprites) using the software supplied on disk. The disk will be updated periodically to include as many printers as possible.

Unlike many HI-RES dump cartridges which only give you one shot at a hard copy of your screen, this one allows you to save your screen to disk for subsequent editing and printing. Many other utilities included on disk for interfacing with PRINTSHOP, PRINT MASTER, NEWSROOM, etc.

Price: \$59.95 (including postage)
NOW AVAILABLE

Controlling your Joystick

So you're a games designer. And you can't get your one eyed, two tailed, three headed, six footed slug to move by joystick control. The answer is really rather simple. Just follow my leads here, and your slug will be moving in no time.

First you must decide which joystick port your game is going to operate on. For a game, or any other application, which is written entirely or partly in BASIC, I advise that you use Port #2. The reason is because a joystick in Port #1 reproduces values which are the same as some keys. If you place your joystick in Port #1 and move it around you will notice garbage appearing on the screen. That means Port #1 is a NO - NO! This leaves us with Port #2.

Okay. Plug your joystick into Port 2, and let's get to business.

The first thing you should know is that both joysticks have a register which holds their values.

JOYSTICK PORT #1. - 56321
JOYSTICK PORT #2. - 56320

These are the memory locations that return the joystick value. The value that I'm talking about is nothing more than a number. You see the joystick registers are updated every 60th of a second. (That's once every interrupt).

The joystick direction is determined, and BITS within these BYTES are set according to the direction. So when we take a look at the contents of these memory locations, we see a decimal number. If the joystick changes direction, the number changes with it. Try typing in this one liner.

10 PRINTPEEK(56320):GOTO10

RUN the program. You should see a stream of numbers flow up the screen. Try moving your joystick, the numbers change with the joystick.

Before we go any further, we should write down what numbers equal what directions. No problems, I've already done it for you. Look below.

JOYSTICK PORT #2.
MEMORY LOCATION - 56320

With the Fire Button

UP - 110
DOWN - 109
LEFT - 107
RIGHT - 103
UP & LEFT - 106
DOWN & LEFT - 105
DOWN & RIGHT - 101
UP & RIGHT - 102
NONE - 111

Without the Fire Button

UP - 126
DOWN - 125
LEFT - 123
RIGHT - 119
UP & LEFT - 122
DOWN & LEFT - 121
DOWN & RIGHT - 117
UP & RIGHT - 118
NONE - 127

So now that we know what values represent what directions, we can get somewhere. If you are going to move an object by joystick, all you have to do is:

- (A) Read the value within the memory location.
- (B) Check the value with a number. eg 110
- (C) If the value is 110, then go to our 'UP' routine.

Of course we will have to check for many different numbers, so as to get all of the directions. This may sound rather difficult, but it's not. If you type in the following program, you should gain a better knowledge of it all.

```
10 PRINT"[CLR]":JOY=56320
15 A=1522:POKEA,160
20 IFPEEK(JOY)=119THEN100:REM JOYSTICK IN RIGHT
POSITION
30 IFPEEK(JOY)=123THEN200:REM JOYSTICK IN LEFT
POSITION
40 IFPEEK(JOY)=125THEN300:REM JOYSTICK IN DOWN
POSITION
50 IFPEEK(JOY)=126THEN400:REM JOYSTICK IN UP
POSITION
60 GOTO20
100 REM *** MOVE RIGHT ***
110 POKEA,32:A=A+1:IFA>2023THEN A=A-1
120 POKEA,160:GOTO20
200 REM *** MOVE LEFT ***
210 POKEA,32:A=A-1:IFA<1024THEN A=A+1
220 POKEA,160:GOTO20
300 REM *** MOVE DOWN ***
310 POKEA,32:A=A+40:IFA>2023THEN A=A-40
320 POKEA,160:GOTO20
400 REM *** MOVE UP ***
410 POKEA,32:A=A-40:IFA<1024THEN A=A+40
420 POKEA,160:GOTO20
```

The above program contains REMs to show you what each part does. Take note of the values being checked, as to the values in the table. So this is all there is to the joystick - checking numbers, and moving objects to match the numbers. However, it isn't quite that simple.

What if you want your object to move on an angle, with the fire button having a function. It's true that this can be done from BASIC, just a matter of checking all 18 directions. This isn't very practical though. For starters, you'd get lost in numbers and different direction routines.

Then there's the problem of the speed of BASIC. CBM BASIC is the tortoise that lost to the hare six times over. The only way that we are going to get the full amount of work from our joystick is with Machine Code. What!! You don't understand Machine Code. Okay, I can handle this, I've done up a mean little program for you. Type it in, and save it to disk, or cassette, before running.

PROGRAMMING

```

10 PRINT "[CLR][6*RHT]LOADING DATA. PLEASE WAIT!"
20 FOR I=49152 TO 49262:READ A:CH=CH+A:POKE I,A:NEXT
30 IF CH<>11213 THEN PRINT "[CLR]ERROR IN DATA
STATEMENTS":END
40 PRINT "CORRECT DATA..SYS49152 TO CALL
JOYSTICK":NEW
100 DATA 169,0,141,167,2,141,168,2,141,169,2,
141,170,2,141,171
110 DATA 2,173,0,220,73,127,41,1,201,1,240,45,
173,0,220,73
120 DATA 127,41,2,201,2,240,42,173,0,220,73,
127,41,4,201,4
130 DATA 240,39,173,0,220,73,127,41,8,201,8,240,
36,173,0,220
140 DATA 73,127,41,16,201,16,240,33,96,169,1,141,
167,2,76,28
150 DATA 192,169,1,141,168,2,76,39,192,169,1,141,169,
2,76,50
160 DATA 192,169,1,141,170,2,76,61,192,169,1,
141,171,2,96

```

Once you have saved it to disk or cassette, type RUN [RETURN]. The screen will clear and display the 'Loading Data' message. There should be a small pause. Not too long after RUNning, you get one of two messages. If you get the 'Error in Data' you will have to check your DATA statements, otherwise you're okay.

Now then, what does this program do? Put simply, it reads any combination of joystick directions possible. (Joystick in Port #2.) I have made it as small as possible so that you can tag it onto your own programs. The way that it works is like this. On typing SYS49152 [RETURN], there are five memory locations affected. There is a memory location for each direction, UP, DOWN, LEFT, RIGHT and for FIRE. These locations are:-

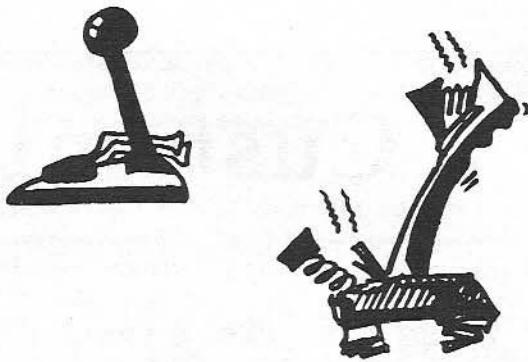

MEMORY ADDRESS	DIRECTION
679	UP
680	DOWN
681	LEFT
682	RIGHT
683	FIRE

These addresses are either set to 0 or 1. 1 stands for YES, and 0 for NO. So if you place your joystick in the position between UP and RIGHT, memory locations 679 and 682 will be set to 1. The rest will be set to 0. To demonstrate this further, type in the small example below.

```

10 PRINT "[CLR][1*UP]UP DOWN LEFT RIGHT FIRE"
20 SYS49152
30 PRINT "[HME][1*DWN]"PEEK(679);";PEEK(680);"
";PEEK(681);"
";PEEK(682);
40 PRINT ";PEEK(683):GOTO20

```

This program gives you a visual display of what directions are being used. Try pushing the fire button while moving up. You see any, and I do mean 'ANY', combination can be used with this routine. You may be wondering how we are going to use this in a practical way. After all, we are still only given five directions, not the full 18. Or are we?

If you think about it, we only have to check five directions to get all 18. This is demonstrated below.

```

10 PRINT "[CLR]":V=53248:FOR I=0 TO 63:POKE 832+I,
255:NEXT
20 X=100:Y=100:POKE V,100:POKE V+1,100:
POKE 2040,13:POKE V+21,1
30 SYS49152
40 IF PEEK(679)=1 THEN GOSUB 100:REM UP
50 IF PEEK(680)=1 THEN GOSUB 200:REM DOWN
60 IF PEEK(681)=1 THEN GOSUB 300:REM LEFT
70 IF PEEK(682)=1 THEN GOSUB 400:REM RIGHT
80 IF PEEK(683)=1 THEN GOSUB 500:REM FIRE
90 GOTO 30
100 Y=Y-1:IF Y=50 THEN Y=Y+1
110 POKE V+1,Y:RETURN
200 Y=Y+1:IF Y=228 THEN Y=Y-1
210 POKE V+1,Y:RETURN
300 X=X-1:IF X=25 THEN X=X+1
310 POKE V,X:RETURN
400 X=X+1:IF X=256 THEN X=X-1
410 POKE V,X:RETURN
500 A=PEEK(V+39):A=A+1:IF A=256 THEN A=0
510 POKE V+39,A:RETURN

```

Before you RUN this program, be sure that you have already placed the Machine Code joystick reader into memory. If you have, which you should have, then away you go.

When the sprite appears on the screen try moving it in any direction. 45 degree angle, either UP or DOWN, to LEFT or RIGHT. Try pressing the fire button. The sprite changes colour. Try moving and firing at the same time. If you jump to your routines using GOSUB, then RETURN back. All directions are scanned, and carried out.

As I mentioned above, I've made the joystick routine as compact as they come. This will allow you to easily tag it onto your own programs for use.

Well, that's all there is to the humble joystick. Happy joysticking.

Customised ROMS

How would you like a new degree of user friendliness? How about the computer displaying 'WELL!!' instead of 'READY.' Or 'Another typo!' instead of SYNTAX ERROR. Jason Briggs explains how.

Yes, you can do it if you want, there's no real difficulty in it. All of the above messages are held within your BASIC rom, and are quite easily changed. The KERNAL rom is a little different, but it too can be customized for your own particular taste.

The Basic ROM

Now then, many of you may be wondering how we are going to change the ROMs. After all, both are Read Only Memory. And under normal conditions, POKEing won't have any effect. The secret is this, the Roms won't be in normal condition. In fact, they won't even be Roms any more, they'll be Ram. Not a bad trick, eh!! And the great part of it all is that it's so simple, that even I can understand it. That must be simple.

First of all you'll need to understand the following demo program. It may do you some good to type it in too, just so that you can see what's going on.

```
10 FOR I=40960 TO 49151:POKE I,  
PEEK(I):NEXT  
20 POKE 1, PEEK(1) AND 254
```

Let's look at these lines. Firstly line 10. To most people this would appear to be doing lots of nothing. But that's where most people are wrong, this line does do a lot. What's happening is this. Inside your C64 (or C64c) there are plenty of Video Banks. In fact your 64 has well over 64k, it wouldn't be an overstatement to say that it has 100s of K. There's only one problem, the machine can only

access 64K at one time. Bit of a let down, or is it?

These Video Banks can be used to store extra information. Then when you need this information, you simply switch out the first Video bank, and replace it with a new Video bank. So when line 10 POKEs into Rom the computer places that value not into the ROM, but into the Video Bank which will be its replacement.

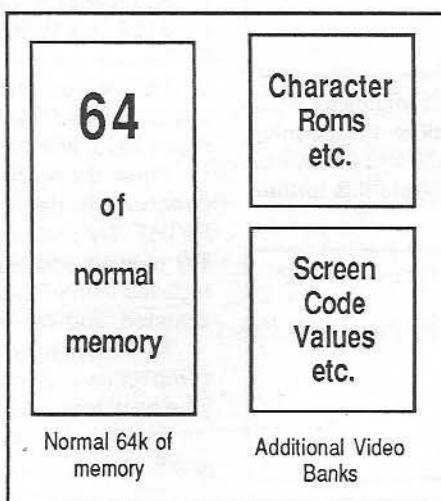

And that's the job of line 20, it simply swaps the Video Banks around. One question that may arise is, why bother with line 10? And the answer is quite easy to understand. If we don't transfer

our BASIC rom into the second Video Bank before swapping them, our computer won't have a BASIC, and that would cause a Crash!! (However it should be noted, that if you're using a machine code program which doesn't use BASIC, then your Basic memory can be used as ram.)

Now run the above demo program. After a small pause, the 'READY.' prompt should be displayed. At first it seems that nothing has changed, but I can assure you a lot has changed. Try POKE 41853,33, you should notice that the full stop in the READY message has changed to a '!' sign. By transferring the BASIC rom, and switching Video Banks, we have in effect changed the BASIC rom into BASIC ram.

This is all very fine, but what is the use behind it? Well, for starters, you can create your very own version of BASIC. To the more advanced Machine Code

· A364 00 4F 4B 00 00 20 20 45	██████████
· A36C 52 52 4F 52 00 20 49 4E	██████████
· A374 20 00 00 0A 52 45 41 44	██████████
· A37C 59 2E 00 0A 00 00 0A 42	██████████
· A384 52 45 41 4B 00 A0 BA E8	██████████

programmer it means being able to change and make new BASIC commands.

Before you can do either of these things you have to know where the messages are stored in memory. And it just so happens that I've given you a memory display of where the keywords and messages are stored.

All of the numbers used in these displays are Hexadecimal. So if you're going to change your Rom from Basic, you'll have to convert these memory locations into decimal. I must also tell you that the ASCII values for new characters have to be used.

Up until now I've only been talking about cosmetic changes, like changing

PROGRAMMING

FOR to FER, and NEXT to NERD. But there are some very handy things that you can do.

For example, everybody knows that if you enter the command PRINTASC(""), the computer will return with ?ILLEGAL QUANTITY ERROR. This can be quite a snag if you're trying to read a response from an INPUT command. There's always somebody out there who'll just press return.

But it is possible to fix them up with a custom rom. If you have your custom rom in memory try typing in this: POKE46991,5. Then try PRINTASC(""), please note that the computer doesn't return an error. Instead you get the value zero. This is only one practical example of what this technique can do. After all you can alter existing Basic routines and even create new ones. All by using this idea.

For the most part this is a topic which is left up to you. It's really a matter of your own personal choice. But before I let you go and terrorize your poor computer, there are a few very important things that you need to know.

In a normal situation, if you were to hit RUNSTOP/RESTORE keys together, it would result in the computer returning to the default Video Bank, and destroying your new Rom. However you can rest easy, because below I have supplied you with a demo program. My program doesn't do much, but it does have two very handy machine code programs in it.

The first lot of data that you will see is a transfer program. The second piece of data is a machine code program that will handle the RESTORE key. I'm telling you this so that you can use them in your own programs.

But there a few things that you'll need to know. The transfer program must always be located at 49152 (\$C000). When you type SYS49152, there should be a little pause of around half a second. Then the normal 'READY' prompt will appear. This will mean that your Basic Rom has been transferred.

The RESTORE routine is for the most part relocatable, the only problem that you have to redirect the NMI interrupt routine. (The pointers to this are at 792 and 793). If you can't understand how to work out Hi byte, Lo byte format, then

PROGRAMMING

forget it! If you don't understand what I mean then you won't really want to relocate it anyway. Just keep its starting address at 48978. To boot up this routine just use the commands: POKE792,82:POKE793,191

That about wraps it up. It's really up to you from here on in. I've given you the basics, you could start by changing the Basic commands. Or you could write your own Basic.

I do however have a few words of warning about the following demo program. Firstly, if you are going to use spaces, use the Shift/Space combination. Your new prompt must be exactly the length given on the screen.

And last but not least, because this program uses the RESTORE key

• A2BE	47	41	40	20	44	49	52	45	41	42
• A2C6	43	04	54	53	50	45	20	40	43	42

• A326	41	C4	9E	A1	AC	A1	B5	A1	43	42

routine, it will mean that the only way for you to exit your customized rom, will be with these commands. POKE1,PEEK(1)OR1. All that does is switch the old Video Bank back

in. (In other words turns the Basic back into Rom).

Well, I've given you the booster that you need. Now it's up to you. Have fun!!

The Sultan's Palace

Commodore 64/128

The \$1000.00 Reward for completing *Sultan's Palace* has been claimed by Chris Hamilton of Wangi-Wangi, NSW.

"Even though the reward has gone I am convinced by the tremendous feedback I have had about the program that it will continue to do well and provide many happy hours of Adventuring to all those who (like myself) love playing Adventure/Arcade games."

Price has now been discounted to \$19.95 and the game is available from:

Gary McCleary Software
 PO Box 24,
 Emu Plains, NSW 2750.

Commodore 64/128

Maths Pack

A must for any student of mathematics at high school or university level.

- * Graph any function (X-Y or Polar co-ordinates)
- * Numerical integration/differentiation/equation solving
- * Solve simultaneous equations (with up to 40 equations and 40 unknowns)
- * Numerical solution of first order differential equations
- * Least square curve fitting
- * Transform and graph any conic
- * Infinite series summation
- * Calculate loan repayments

Star Pack

- * A planetarium display of the heavens from anywhere on earth
- * Locate any object anywhere any time
- * Easy to follow instructions

Talking Sam

- * Is this artificial intelligence on the Commodore 64?

3 in 1 offer includes all three programs on one disk for \$24.95 from

Gary McCleary Software,
 PO Box 24, Emu Plains, NSW 2750.

Oscilloscope

by Kyle Arnold

Oscilloscope will quite simply turn your 64 into an oscilloscope, that will produce static displays of waveforms from one cycle per second to at least 10 thousand cycles per second.

The program itself is pretty straightforward. All you have to do is follow the prompts. When the program is first run, you will be asked to stand by while the machine code routines that handle the hires graphics and sound sampler are loaded into memory.

Then you will get the title screen (very simple) asking you for the speed number. This can be any number from 1 to 255, which actually allows you to adjust the band width of your digital Oscilloscope. Where numbers around five are for frequencies 500 cycles per second and higher, and numbers around 100 and up are for the very low frequencies. You may decide after a bit of experimenting which numbers best suit the frequencies you wish to display.

After you have entered the Speed number you will then be asked to press the space bar to continue. This will allow you time to properly set up your sound source. This is plugged into joy.port one via an adapter which you have to construct. As the circuit diagram shows it is very simple, and how you set it up is entirely up to you.

The parts - one 150K resistor and one audio transformer (1K/8 ohm) are available in any store that sells electronics parts. The connector to the joy port however, I have found a little difficult to find, but I found the connector and lead of an old joystick quite suitable. As the 64 does not have a sensitive input you do require the use of an amplifier for your sound source. I have found that a

cassette recorder was quite suitable for this purpose. For testing, the sound from a tranny radio was quite adequate.

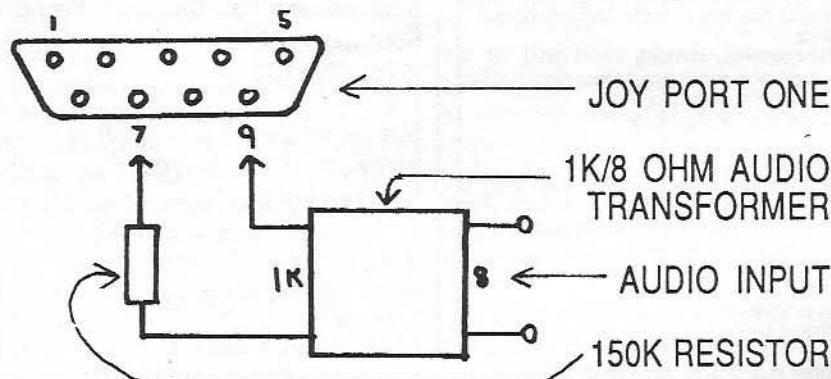

If everything is okay press the space bar and stand by while the program does the rest. The boarder will change colour indicating what is happening, RED=sound sampler is active; Purple=Program is computing the data; Grey=Program is creating the display; Green=Display is complete.

When the display is completed, the program halts until you press a key. Pressing any key will prompt the program to ask you if you wish a printout (try that on a real oscilloscope). The Printout, should you choose one, will be printed out on a 1520 printer plotter.

When all is done you will be taken back to the beginning of the program to sample more sounds or maybe adjust the settings until you have it right for the particular sound source you are trying to display.

A few things to note before I finish, however, are as follows: You will note that the display is a little below the centre of the screen. This is so, to produce an accurate display. Make sure you only have the two connections to the joy port as other connections can cause the program to halt. For best results use a single 150K/8 ohm transformer without the resistor, but as these transformers are pretty rare the present circuit will do the job very well.

Circuit of C64 Oscilloscope Adapter.

Holiday Specials

Just call (02) 498 3204 NOW to place your order over the phone! Or POST the form below.

Imagineering Entertainment & Business

<i>Game</i>	<i>Cassette</i>	<i>Diskette</i>	<i>Paperback Filer</i>	\$79.00

POWER CARTRIDGE®

A special KCS switching technique allows a program to be stored completely outside the memory of your Commodore 64/128. Using this system KCS developed the POWER CARTRIDGE. The 16K Cartridge, 100% machine code, gives the user an optimal extension to his normal computer.

POWER TOOLKIT

A powerful BASIC-Toolkit (Additional helpful commands) that considerably simplifies programming and debugging.

AUTO	HARDCAT	RENUMBER
AUDIO	HARDCOPY	REPEAT
COLOR ,	HEX\$	SAFE
DEEK	INFO	TRACE
DELETE	KEY	UNNEW
DOKE	PAUSE	QUIT
DUMP	PLIST	MONITOR
FIND	ILOAD	BLOAD

RENUMBER : Also modifies all the GOTO's GOSUB's etc. Allows part of a programme to be renumbered or displaced.
PSET : Set up of printer type.
HARDCAT : Prints out Directory.

The toolkit commands can be used in your programmes.

DISK TOOL

Using POWER CARTRIDGE you can load up to 6 times faster from disk. The Disk commands can be used in your own programmes.

DLOAD	DVERIFY	DIR
DSAVE	MERGE	DEVICE
DISK		

MERGE : Two BASIC programmes can be merged into one.
DISK : With DISK you can send commands directly to your disk.

TAPE TOOL

Using POWER CARTRIDGE you can work up to 10 times faster with your data recorder. The Tape commands can be used in your own programmes.

LOAD	SAVE	VERIFY
MERGE	AUDIO	

POWERMON

A surprisingly powerful machine language monitor that is readily available

and leaves all of your Commodore memory available for programming. Also works in BASIC-ROM, KERNEL and I/O areas.

A ASSEMBLE	I INTERPRET	S SAVE
C COMPARE	J JUMP	T TRANSFER
D DIS-	L LOAD	V VERIFY
	ASSEMBLE	M MEMORY
F FILL	P PRINT	W WALK
G GO	R REGISTER	X EXIT
H HUNT		\$ DIRECTORY
		DOS Commands

PRINTER TOOL

The POWER CARTRIDGE contains a very effective Printer-Interface, that self detects if a printer is connected to the Serial Bus or User-Port. It will print all Commodore characters on Epsōn and compatible printers. The printer-interface has a variety of set-up possibilities. It can produce HARDCOPY of screens not only on Serial printers (MPS801, 802, 803 etc) but also on Centronic printers (EPSON, STAR, CITIZEN, PANASONIC, etc). The HARDCOPY function automatically distinguishes between HIRES and LORES. Multi-colour graphics are converted into grades of grey. The PSET functions allow you to decide on Large/Small and Normal/Inverse printing. The printer PSET functions are:

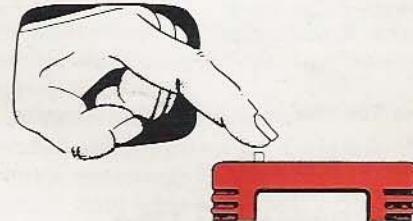

PSET 0 - Self detection Serial/Centronics.
PSET 1 - EPSON mode only.
PSET 2 - SMITH-CORONA mode only.
PSET 3 - Turns the printing 90 degrees!!
PSET 4 - HARDCOPY setting for MPS802/1526.

PSET B - Bit-image mode.
PSET C - Setting Lower/Upper case and sending Control Codes.
PSET T - All characters are printed in an unmodified state.
PSET U - Runs a Serial printer and leaves the User-port available.
PSET Sx - Sets the Secondary address for HARDCOPY with Serial Bus.

PSET L1 - Adds a line-feed, CHR\$(10), after every line.

PSET L0 - Switches PSET L1 off.

POWER RESET

On the back of the POWER CARTRIDGE there is a Reset Button. Pressing this button makes a SPECIAL MENU appear on the screen.

This function will work with any programme.

CONTINU - Allows you to return to your program.
BASIC - Return to BASIC.
RESET - Normal RESET.
TOTAL - Saves the contents of the memory onto a Disk. The programme can be reloaded later with BLOAD followed by CONTINUE.
BACKUP - RESET of any programme.
DISK - As BACKUP DISK but to TAPE.
RESET ALL - As BACKUP DISK but to TAPE.
HARDCOPY - At any moment, prints out a Hardcopy of the screen. Using CONTINUE afterwards you can return to the program.
MONITOR - Takes you into the Machine language Monitor.

... it's dynamite!
